1. A piece of thin, light fabric, especially bunting, usually rectangular and oblong or square, but sometimes triangular, notched, or otherwise varied in form, ranging from a few inches to several yards in dimensions, used hanging free from a staff to which it is attached or connected by one end, for many purposes, as a signal, symbol, cognizance, or standard, and differing in size, color, and emblematic marking or ornamentation, according to its intended use. The most common employment of flags is as military ensigns, colors, or standards, or emblems of nationality in all its modes of visible manifestation. In the army a flag is a banner by which one regiment is distinguished from another, and is usually called the *colors*. In the navy flags are borne at the masthead not only to designate the nationality of a vessel, but also to indicate the rank of the officer in command, an admiral's presence being denoted by his flag at the main, a vice-admiral carrying his flag at the fore, and

a rear-admiral at the mizzen. In the United States navy admirals' flags are blue, with four, three, or two stars, according to rank. When the President goes aboard, the national flag is displayed in the bow of his barge, or at the main of the man-of-war which receives him. In the British navy the supreme flag is the royal standard, which is to be hoisted only when the sovereign or one of the royal family is on board; the second flag has an anchor on a red ground, and characterizes the lord high admiral or lords commissioners of the admiralty; and the third is the union or national flag, in which the crosses of St. George, St. Andrew, and St. Patrick (the patron saints of England, Scotland, and Ireland respectively) are blended. This flag is appropriated to the admiral of the fleet. (See *ensign*, and *union flag*, under *union*.) The flag of the United States has since 1818 consisted of thirteen horizontal stripes (representing the thirteen original States of the Union), seven red and six white, placed alternately, with a blue union having displayed on it one white five-pointed star for each State in the Union. The Confederate flag had a similar union, but bore three bars, two red and one white, instead of the thirteen stripes. Flags are also used aloft and ashore for signaling. Flags are often raised on public buildings to show that they are open for business, or (as on the Capitol at Washington) that a legislative body is there in session. So, formerly, play-houses exhibited flags on their roofs when there were performances at them. When the players were out of employment, they were said to be *flag-fallen* (which see).

'Twas a shame, no less
Than 'twas his loss, to curse your flying flags,
And leave his navy gazing. *Shak.*, A. and C., III. 11.

During an engagement the bearer may be refused admittance into the lines, or he may be held. A flag of truce is regarded as especially sacred in character and significance, and any abuse of its privileges, as for the purpose of surreptitiously procuring military information, is condemned as an offense of peculiar heinousness. In naval engagements a flag of truce is met at a suitable distance by a boat from the senior officer's ship, in charge of a commissioned officer, and having a white flag plainly displayed from the time of leaving until her return.—*Carroll* flag, a large flag furnished to the principal military posts in the United States, to be displayed on occasions of national importance.—Knight of the square flag. By the semblance
Of their white flags display'd, they bring us peace.
Shak., *Pericles*, I. 4.

Yellow flag, a flag of a yellow color used as a sanitary signal. It is displayed on a vessel to show that contagious or infectious disease exists on board, or that the ship or boat has been placed in quarantine; over the house, ship, or boat which serves as the residence of a quarantine officer; and in time of war to indicate hospitals or other houses containing the sick or wounded, that the enemy may refrain from firing on them. In this case it is called the *flag of protection*.

II. *n.* One who whips or scourges himself for religious discipline; specifically, in *hist.*, one of a body of religious persons who believed they could thus appease the divine wrath against their sins and the sins of the age. An association of flagellants founded in Italy about 1200 spread throughout Europe, its members marching in processions, publicly scourging their own bare bodies till the blood ran. Having by these practices given rise to great disorders, they were suppressed; but the same scenes were repeated on a larger scale in 1348 and several subsequent years, in consequence of the desolating plague called the "black death." These flagellants claimed for their scourgings the virtue of all the sacraments, and promulgated other heresies. There have been also fraternities of flagellants authorized by the Roman Catholic Church. Some flagellants have held doctrines opposed to the Roman Catholic Church, and approximating those of Protestantism.

When, from the corruptness of its ministry, religion has lost its influence, as it did just before the *Flagellants* appeared, the State has been endangered.

endoplast and a contractile vacuole, but no permanent oral aperture, though there is an oral region of the body constituting the food-vacuole, by which food enters along with a globule of water. The flagella are locomotory organs. The cell of which a flagellate infusorian mainly consists differs much in form in the different genera, being sometimes prolonged around the base of the flagellum like a collar, and the whole animal may have a calcareous investment. The flagella of the same animal may differ much, one being stout and only occasionally moved, the other forming a delicate cilium in constant vibration. The *Flagellata* multiply by various methods of fission and sporulation, and also by conjugation. Also called *Mastigophora*.—*Flagellata discostomata*. Same as *Choanoflagellata*.—*Flagellata eustomata*, an order of animalcules possessing one or more flagelliform appendages, but no locomotive organs in the form of cilia, a distinct oral aperture or cytostome invariably developed, multiplying by longitudinal or transverse fission, or by the subdivision of a whole or part of the body-substance into sporular elements.—*Flagellata pantostomata*, an order of animalcules simply flagelliferous, having in their characteristic adult state no supplementary lobate or ray-like pseudopod-like appendages, oral or ingestive area entirely undefined, food-substances being ingested indifferently at all points of the periphery.

A small flat or scale-like particle or fragment of anything; a thin fragment; a scale: as, a flake of tallow; a flake of flint; a flake of snow. As applied to chips or fragments detached from a mass of rock or mineral, *flake* often refers especially to such chips or fragments produced in the process of making stone weapons, especially in prehistoric times. Flint and obsidian are the materials which, in consequence of their characteristically conchoidal fracture, can most readily be made to take a desired form by chipping or flaking; but when these were not to be had, chert, jasper, quartz, and even rocks of various kinds, have been utilized in this way. There are many localities where these chips or flakes (as the larger and more regular chips are sometimes designated), cores, broken tools, stone hammers, and other similar relics, are found heaped together in large quantities, indicating the abandoned sites of workshops.

Cf. *phlegm* (formerly also *flem*, etc.).] **1.** A blaze; vapor in combustion; hydrogen or any inflammable gas in a state of visible combustion. Flame is attended with great heat, and generally with the evolution of much light; but the temperature may be intense when the light is feeble, as is the case with the flame of burning hydrogen gas. The flame of a burning body, as of a candle, may be divided into three zones: an inner zone, containing chiefly unburned gas; a central, containing partially burned gas; and an outer, in which the gas is completely consumed by combination with the oxygen of the air. The luminosity of flame depends upon the presence of solid matter or of dense gaseous products of combustion.

The *reducing flame* (as of a blowpipe) is that part of the flame which is deficient in oxygen for combustion (RF in figure), and which has therefore a reducing effect, or, in other words, tends to deprive the substance under examination of oxygen; the *oxidizing flame* is that part (OF in figure) in which the oxygen is in excess, and which exerts the opposite or oxidizing effect. The distinction is important in blowpipe analysis.

The connection of thought is not obvious; a clue has been sought in the point of view suggested in Milton's lines:

This species, of unknown origin, has been in cultivation from a very remote period, and yields the principal vegetable fiber in popular use over the larger part of the old world. The plant is an annual, with slender stems about two feet tall, which by various processes are freed from all useless matter, leaving the elongated bast-cells in the form of a soft, silky fiber. This fiber is used in the manufacture of linen thread and cloth, cambric, lawn, lace, etc. The principal sources of supply are Russia, Germany, the Netherlands, and Ireland. The flowers are blue. The seeds, known as *linseed* and *flaxseed*, are very mucilaginous, and are used on that account in medicine. They also yield an oil, which is extensively used by painters; and the residue, called *linseed-cake*, has much value as feed for cattle. Order of the Golden Fleece, an order founded by Philip the Good, Duke of Burgundy, in 1430, on the occasion of his marriage with the infanta Isabella of Portugal. The office of grand master passed to the house of Hapsburg in 1477 with the acquisition of the Burgundian dominions, which included the Netherlands. After the time of the emperor Charles V. (died 1558) this office was exercised by the Spanish kings; but after the cession of the Spanish Netherlands to Austria the latter power in 1715 again claimed the office. The dispute remains undecided, and the order therefore exists independently in Austria and in Spain. The badge of the order is a golden ram pendant by a ring which passes round its middle. This hangs from a jewel of elaborate design, with enamelling of several colors, various suggestive devices, and the motto "Pretium laborum non vile."

Dan. flint* = *Sw. flint* (in comp.), *G. flinte* (whence *Bohem. and Pol. flinta*, *Lett. plinte*), a gun; see *flint-lock*.] *I. n.* 1. A form of silica, somewhat allied to chalcedony, but more opaque, and with less luster. It is usually of a light-gray or brownish color. It has a peculiarly well-marked conchoidal fracture, and can easily be broken up into fragments having sharp cutting edges. For this reason, and because of its hardness, which is proverbial, flint was most extensively used in prehistoric times for all kinds of cutting implements. The use of flint as a means of striking fire with a steel, and especially as a part of the once almost universally used musket-lock, is well known. Flint occurs in large quantity in the form of nodules, and even sheets or beds, in the chalk of England and France, and has been formed by the slow replacement of carbonate of lime by silica held in solution in water. It is abundant in the United States, generally in massive forms. The exterior of most flints is of a lighter color than the interior, this difference being caused by a rearrangement of the particles of the silica.

Then he took up the Eldridge sword,
As hard as any flint.

II. *a.* 1. Made or composed of flint.—2. Hard and firm, as if made of flint: as, *flint corn* or *flint wheat*.—**Flint implements**, in archæol., implements used by man before the use of metals, so called because, although occasionally found of granite, jade, serpentine, jasper, basalt, and other hard stones, these first studied, as well as the most numerous examples, are formed of flint. They consist of arrow-heads, ax-heads or celts, lance-heads, knives, wedges, etc. Flint implements have been found in many regions of the globe; often, as in the Somme valley in France, in apparently upheaved beds of drift, and in connection with the remains of extinct species of the elephant, rhinoceros, and other mammals, whence man's existence on the globe at a geological period anterior to the present has been inferred. Flint implements are still used by some savage tribes.

flint-glass (flint'gläs), *n.* A variety of glass in which the silica is combined with oxid of lead in greater or less quantity. The larger the amount of lead the higher the specific gravity and the refractive power, and the greater the brilliancy of the product. Flint-glass is often called *crystal glass*, or simply *crystal*, while some limit the name *flint-glass* to the variety specially made for optical purposes. Besides the oxid of lead, potash is an essential ingredient of flint-glass or crystal. Analyses of different kinds of crystal show the presence of from 28 to 37 per cent. of oxid of lead, 14 to 17 of potash, and 52 to 59 of silica. The flint-glass of Guinand, used for optical purposes and generally admitted to be of unrivalled excellence, contains about 43 per cent. of oxid of lead and 12 of potash. The brilliancy of crystal glass fits it for use for ornamental purposes, and especially for the most showy and expensive table-ware. The characteristic luster and sparkle due to the high refractive power of the material is brought out by cutting and polishing, exactly as is done in the case of gems. Owing, however, to its softness, crystal glass is easily scratched by careless handling and dulled by wear. The name *flint-glass* originated in the fact that the silica first used in England for the manufacture of this article was derived from flint. An essential requisite for good flint-glass is purity of the material employed, and the form of the furnace and of the melting-pots are peculiar. Great technical skill is required for the production of the best kind of glass for optical purposes. See *glass*, *strass*, and *lens*.

I assisted at the birth of that most significant word *firtation*, which dropped from the most beautiful mouth in the world, and which has since received the sanction of our most accurate Laureat in one of his comedies. Some inattentive and undiscerning people have, I know, taken it to be a term synonymous with coquetry: but I lay hold of this opportunity to undeceive them, and eventually to inform Mr. Johnson that *firtation* is short of coquetry, and intimates only the first hints of approximation, which subsequent coquetry may reduce to those preliminary articles that commonly end in a definite treaty.

Chesterfield, quoted in Brit. Essayists, c. 210.

It is afterward, for the most part, affixed to the tip of the growing new feathers, of which it is the precursor, or rather the first-formed part, and finally falls off, not to be renewed. In ptilopod birds the flocus is associated only with the true plumage, sprouting from the future pterylic alone; in ptilopod birds it sprouts also from the apteria or featherless parts, and so far is not connected with the future plumage; in such cases the whole body is densely clothed.

=Syn. *Fluctuate*, *Vacillate*, *Waver*, *Oscillate*, *Undulate*,
apply to literal or figurative movements to and fro, or up
and down; but *undulate* is used only physically, as of the
sea, sound-waves, etc. *Fluctuate*, *waver*, and *undulate*
in their figurative uses are founded upon the rise and fall
of waves; *oscillate* refers to the swinging of a pendulum.
Vacillate, and next to it *waver*, suggests the most of men-
tal or moral indecision. *Oscillate* naturally suggests the
most regular alternations of movement to and fro. *Vaci-*
llate and *waver* are now rarely used of physical things;
waver is also used of a hesitation that seems likely to end
in yielding.

He had by no means undoubting confidence in the *fluc-*
tuating resolutions of Legester, whose mind seemed to
him agitated beyond the government of calm reason.
Scott, *Kenilworth*, xxxix.

flue¹ (flō), *n.* [= *Se.* *flōw*. Origin obscure; per-
haps connected with *MD.* *D.* *vloegh*, grooves,
channels, the flutes of a fluted column. There
is no evidence to connect the word with *OF.*
fluo, *fluie*, a flowing, a stream (< *L.* *fluvi*us, a
stream). Skeat considers *flue* to be "a mere
corruption of *flute*," citing in support of this
view the use in Phæar's *Virgil* (see extract un-
der def. 2); but such a corruption of an estab-
lished word like *flute* at the period concerned
is scarcely possible; Phæar's *flue*, if not a mis-
print for *flute*, is prob., like *flue* in organ-build-
ing (def. 3), merely a deflected use of *flue* in
the ordinary sense, with some ref. to the acci-
dentially similar *flute*.] 1. A duct for the con-

II. 1. A substance which flows or is capable of flowing; a substance which is incapable of resisting forces (tangential stresses) tending to change its shape without altering its size. A *fluid* has absolutely no tendency to spring back to its original shape when distorted, except in virtue of a surface tension. A perfect *fluid* is a fluid in which a bending stress produces an instantaneous strain—that is to say, there is no delay in taking a form of equilibrium, except what is due to the masses of the particles: opposed to a *viscous fluid*, in which the yielding is not instantaneous, and to a *plastic solid*, which yields instantaneously to a sufficient, but not to a very small, stress. Fluids are divided into liquids and gases or vapors. Gases or elastic fluids tend to

expand indefinitely while preserving their homogeneity: liquids or *inelastic fluids* tend to expand indefinitely, but only by evaporation—that is, by separating into two parts with a bounding surface between them. (See *liquid, gas, and ether*.) In the early history of physical science the phenomena of heat, electricity, and magnetism were supposed to be due to the motions of peculiar imponderable fluids; hence the expressions *north and south magnetic fluid*, the *electrical fluid*, etc., which still linger (but not with good writers), though the explanation of the phenomena has changed with the advance of knowledge.

A *fluid* is a body the contiguous parts of which act on one another with a pressure which is perpendicular to the surface which separates those parts.

Clerk Maxwell, Heat, p. 95.

Benedict, Coal-tar Colours (trans.), p. 25.

fluorescence (flû-ô-res'ens), *n.* [= *F. fluorescence* = Sp. Pg. *fluorescencia*; as *fluorescent* (t) + *-ce*.] The property possessed by some transparent substances of becoming self-luminous while they are exposed to the direct action of light-rays. See *phosphorescence*. It is especially excited by the violet and ultra-violet rays of the spectrum, and is explained by the change in refrangibility (that is, wave-length) of the incident rays by the substance under experiment. Thus if a beam of sunlight fall upon a solution of esculin or sulphate of quinine, its path through

the liquid is marked by a bluish opalescent light. Again, if a paper moistened with the solution is exposed to the ultra-violet rays of the spectrum, it becomes blue, since these rays are diminished in refrangibility so as to become visible; by this means the ultra-violet spectrum (given by prisms of quartz) can be studied. The delicate blue surface-color of some fluor-spar and the yellowish-green surface-color of glass colored with uranium oxid (canary glass) are phenomena of the same nature. For some years previous to 1852 the phenomenon was termed *epilopic dispersion*.

I am almost inclined to coin a word, and call the appearance *fluorescence*.

Stokes, Philos. Trans., 1852, p. 479, note.

fluorescent (flû-ô-res'ent), *a.* [= *F. fluorescent* = Pg. *fluorescente*; as *fluoresce* + *-ent*.] Possessing the property of fluorescence; exhibiting fluorescence.

In every case the *fluorescent* light appears to belong to a less refrangible part of the spectrum than does the incident light which gave rise to it, thus affording an instance of dissipation, or degradation of energy.

Tait, Light, § 199.

Fluorescent solutions rapidly absorb those rays which are the effective cause of their luminosity.

Daniell, Prin. of Physics, p. 456.

Fluorescent eyepiece, a form of eyepiece, as that of *Soret*, used with the spectroscopic in examining the ultra-violet spectrum made visible by fluorescence.

fluorin, **fluorine** (flû'ô-rîn), *n.* [*fluor* + *-in*, *-ine*.] Chemical symbol, F; atomic weight, 19. A gaseous element, not known in a free state, since its isolation is a matter of great difficulty and of some doubt. It forms with other elements a group of compounds called *fluorides*. The commonest of these is calcium fluoride, or fluor-spar. Fluorin occurs abundantly in the mineral kingdom, as in fluor-spar, cryolite, and other minerals, and also in minute quantity in the teeth and bones of animals.

fluorite (flû'ô-rîr), *n.* [*fluor* + *-ite*.] Same as *fluor-spar*.

fluor-spar (flû'ôr-spâr), *n.* [*fluor*, a flow, flux (see *def.*), + *spar*.] A common mineral, the fluoride of calcium, CaF₂, found in great beauty in Derbyshire, England, and hence also called *Derbyshire spar*. It occurs both massive and crystallized, in simple forms of the isometric system, namely the cube, octahedron, dodecahedron, etc., and in combinations of these. Pure fluor-spar contains 48.7 per cent. of fluorin and 51.3 of calcium. It is of frequent occurrence, especially in connection with metalliferous beds, as of silver, tin, lead, and cobalt ores. It is sometimes colorless and transparent, but more frequently exhibits tints of yellow, green, blue, and red. From the general prevalence of a blue tint in the Derbyshire specimens, it is there known as *blue-john*. It is often beautifully banded, especially when in nodules, which are much prized for the manufacture of vases, and occasionally used for beads, brooch-stones, and other ornamental purposes, although it is of inferior hardness. Some varieties exhibit a bluish fluorescence; and all kinds phosphoresce on gentle heating, especially the variety chlorophane, which emits a beautiful green light. The name *fluor* has reference to its use as a flux to promote the fusion of certain refractory minerals. Also called *fluorite*.

fluosilicate (flû-ô-sîl'î-kât), *n.* [*fluosilic-ic* + *-ate*.] 1. In chem., a compound of fluosilicic acid with some base.—2. In mineral., a silicate containing fluorin as an essential part. See *fluophosphate*.

[flush. The several words spoiled *flush*, being mostly dialectal, colloquial, or technical, and scantily recorded in early literature, have become partly confused with one another, and cannot now be entirely disentangled. Words originally different have acquired some meanings very nearly identical, while on the other hand there are some meanings not obviously related which are, nevertheless, to be referred to one original. The separation made in the following articles is based on the present differences of sense, and is probably more minute than the etymology, if fully known, would require.]

In music, an instrument of the pipe kind, in which the tone is produced by the impact of a current of air upon the edge of a hole in the side of a tube. See *pipe*, *fife*. having a mouth-hole in the side of the tube, which is held across the player's body. In both species finger-holes in the tube control the pitch of the tones; and in both increased force in blowing raises the pitch an octave. The exact explanation of the production of the tone is somewhat uncertain. It is asserted that the stream of air, being usually flat, acts like a free reed in the opening, playing back and forth like a solid tongue.

The species of the family are pelagic, and representatives are found in almost all the tropical and warm seas. They associate together in schools of considerable size. The aerial flight is not strictly entitled to the name, for the pectoral fins are not used in active progression, but are simply employed as parachutes. . . . L. focus, a fireplace, a hearth (*ML. also the seat or central point of a disease*). Hence ult. (*< L. focus*) *fusi¹* = *fuse¹* = *fuse²*, *focage, feuage, foyer, fuel*, etc.] 1. In optics, a point at which rays of light that originally diverged from one point meet again, or a point from which they appear to proceed. The former is called a *real*, the latter a *virtual focus*. The principal focus of a lens is the focus of rays striking the lens parallel to its axis. The conjugate foci of a mirror or lens are two points so situated that the rays emitted from a luminous body at either point are reflected (by the mirror) or refracted (by the lens) to the other. See *conjugate mirror* (under *conjugate*), *lens*, and *mirror*.

A *focus* . . . may be defined as the point to which a spherical wave converges, or from which it diverges. It may also be defined as the point at which little waves from all parts of a great wave arrive at the same time.
Airy, Optics, § 44.

Every lens which becomes thicker towards its periphery has virtual *foci*; and vice versa, for the focus of a lens to be real, the lens must be thicker in the middle than at the edge.
Lommel, Light (trans.), p. 90.

2. In geom., a point from which the distances to any point of a given curve are in a syzygetic relation. Thus, the sum of the distances of any point of an ellipse from its foci is constant, and the difference of the distances of any point of a hyperbola from its foci is constant. A modern definition is that the foci are the intersections of common tangents of the curve and the absolute. In like manner, a focus of a surface is a point on the curve of intersection of common tangent planes of the surface and the absolute. See cuts under *Cartesian* and *ellipse*.

3. In the theory of perspective, with reference to two planes in perspective, one of four points—two, *F₁* and *F₂*, on one plane, and two, *f₁* and *f₂*, on the other—such that the angles between two points on the first plane measured at *F₁* are equal to the angles between the corresponding points on the other plane measured at *f₁*, and so with the pair of foci *F₂* and *f₂*. One pair of foci are called *similar*, because the angles are measured in the same direction on the two planes; the other pair are called *dissimilar*, because the angles are measured in opposite directions.

4. Figuratively (with a consciousness of the classical Latin meaning), a central or gathering point, like the fire or hearth of a household; the point at or about which anything is concentrated; a center of interest or attraction.

The virtue and wisdom of a whole people collected into one focus.

Mrs. Gaskell, Sylvia's Lovers, xxii.

Acoustic focus, a point to which sound-waves are converged, as by reflection in the case of a room having an ellipsoidal ceiling.—**Focus of mean motion**, the empty focus of the orbit of a planetary body: so called because when the orbit is nearly circular the planet describes in equal times nearly equal angles about this focus as a vertex.—**Focus of true motion**, that focus of the orbit of a planetary body which is occupied by the central body.—**Heat-focus**, the point to which the invisible heat-rays are converged, as those from the sun by a convex lens.

In focus, situated or fixed at a focal point, or so as to secure or exhibit a focal effect: said (1) of the condition of an image projected by a lens, or seen through a lens, when this image appears sharp and clearly defined; (2) of the position of the lens with reference to a screen or ground-glass upon which such image is projected, or of the position of the screen or ground-glass with reference to the lens; (3) of a photographic positive or negative picture accurately produced by the agency of a lens.

While your head is still under the focusing-cloth, pass your hand round to the lens, and move the rack backward and forward till you find the point at which it is most distinct. It is then said to be "in focus," or "sharp."

Its direction is from the south, less often from the south-west, and it is felt most in the valleys having a general north-and-south trend. It is most common in the autumn and winter, and exerts an important influence upon the meteorological condition of the places subject to it: for example, by rapidly removing the snow in spring, ripening the grapes in autumn, etc. A similar warm, dry wind is recognized in other parts of the world, as on the west coast of Greenland and in New Zealand. The chinook wind of the northwestern United States is a similar phenomenon.

Of local winds the most remarkable are the *föhn*, in the Alps, distinguished for its warmth and dryness, etc.

fog¹ (fog), *n.* [Dan. *fog*, spray, shower, drift, storm, in comp. *sne-fog*, a snow-storm, blinding fall of snow, = Icel. *fok*, spray, any light thing tossed by the wind, a snow-drift; cf. *fjūk*, a snow-

storm, < *fjūka* (pret. *fauk*, pp. *fokinn*), be driven on, be tossed by the wind (of spray, snow, dust, etc.), = Sw. *fylka* (Cleasby) = Dan. *fylge*, drift, collog. rush, dial. *fuge*, rain fine and blow.] 1. The aggregation of a vast number of minute globules of water in the air near the earth's surface, usually produced by the cooling of the air below the dew-point, whereby a portion of its vapor is condensed. The cooling may be the result of radiation, conduction, mixture with colder air, or ascension. Over surfaces of water warmer than the air the fog produced by cooling is increased by the continued evaporation of the water into the already saturated air. Solid particles in the air constitute nuclei for condensation, and are thereby great promoters of the formation of fog. In a ship's log-book, abbreviated *f*.

Therefore the winds, piping to us in vain,

As in revenge, have suck'd up from the sea

Contagious *fogs*.

Shak., M. N. D., ii. 2.

Foliation may be congenial with the formation of the rock itself, or posterior to it: in the latter case the epithet *foliated* indicates a structure not essentially different from that more generally designated as *schistose*. The relations of foliation to cleavage are somewhat obscure. The essential difference between them appears to be that cleavage is rarely well developed except in fine-grained, argillaceous rock, which by its effects is usually rendered capable of almost indefinite subdivision in one direction, while foliation separates the rock into bands sometimes quite distinct from each other in mineral character, these bands being also not infrequently more or less irregular in thickness and rather lenticular in form. By some geologists it is thought that in foliation a more advanced stage of metamorphism has been reached than that indicated by cleavage; but it is also highly probable that the original lithological and structural character of the mass had much to do with bringing about the observed differences. See *schist* and *schistose*.

If the foot shall say, Because I am not the hand, I am not of the body; is it therefore not of the body? 1 Cor. xii. 15.

Many a light foot shone like a jewel set In the dark crag. *Tennyson, Princess*, iii.

In man the feet are the terminal segments of the posterior limbs, corresponding to the hands or the anterior extremities, and extending from the ankle-joint or tibiotarsal articulation to the end of the toes. The foot is divided into three parts, the tarsus or ankle, the metatarsus or instep, and the phalanges, digits, or toes. It contains 26 bones: namely, 7 tarsals, the astragalus, calcaneum, scaphoid, cuboid, and 3 cuneiform bones; 5 metatarsals; and 14 phalanges, 3 to each of the digits except the great toe, which has 2. The axis of the foot is at right angles with that of the leg, and the whole sole rests upon the ground. The principal muscles acting upon the foot are the anterior and posterior tibial, the three peroneal, the gastrocnemius and soleus, and the flexors and extensors of the toes. In many mammals the structure of the foot is much the same as in man, especially in those which are plantigrade; but the term is extended usually to the corresponding segment of the fore limb.

In digitigrade mammals which walk upon the toes, as cats and dogs, or upon the ends of the toes, as in hoofed quadrupeds, the foot, properly speaking, extends up the limb: thus, in the horse, for example, the feet reach up to the hock of the hind limb and the so-called knee of the fore limb (see cut under *personality*); but in popular language foot is restricted to the phalangeal part of the foot, which rests on the ground in walking. In birds the foot is properly the whole of the hind limb up to the tibiotarsal joint, commonly but wrongly called the knee, and includes the tarsometatarsus and toes; but it is popularly restricted to the toes alone. In reptiles and batrachians which have limbs, the foot is the terminal segment of either fore or hind limb, as in other vertebrates. The hind foot is technically called the *pes*.

2. In invertebrate animals, some part serving the purpose of a foot. (a) In mollusks, any surface or part of the body upon which the animal rests or moves. It is often extensible or protrusible, as in gastropods, and is technically called the *podium*. See cuts under *Helicidae* and *Lamelibranchiata*. (b) In insects, specifically, the tarsus. (c) In arthropods, the leg. The modifications of the limbs have different names, as *swimming-foot* or *ptopods*, *ambulatory foot*, etc. (d) In worms, one of the bristly appendages called *parapodia*. See cut under *prætorium*. (e) In echinoderms, a tubular prolongation of the body through an ambulacrum. See *tube-foot*. (f) In protozoans, a temporary prolongation of the body, called a *false foot*. See *pseudopodium*.

10. A unit of length, originally the length of a man's foot. Abbreviated *ft.* The English foot (in use in the United States) contains 12 inches, and is equal to 30.48 centimeters. It seems to have slightly lengthened since the time of Henry VII. The foot in use in different European countries before the introduction of the metric system varied from 9 to 21 English inches. The ancient Roman foot is known from a number of extant standards to have been equal to 11.65 English inches. Other ancient feet are of uncertain length, even when their existence is not in doubt; especially, there is at present much dispute concerning the Attic foot. (See *geometrical foot*, below.) The following table gives the prevalent opinions concerning the lengths of the ancient feet and well-determined values of the more important modern units of this name, all expressed in English inches:

11. In *pros.*, a group of syllables, of which one is distinguished above the others, which are relatively less marked in enunciation; a section of a rhythmic series consisting of a thesis and an arsis. The Greeks first gave the name *foot* (*mois*) to the group of tones marked by and coincident with one rise and one fall of the human foot in dancing or in beating time. The time or syllable marked alike by the lotus or stress of voice, and by the beat of foot or hand in marking time, they accordingly called the *thesis* (*thesis*) or 'setting down' (of the foot), and the remaining interval before or after this the *arsis* (*arsis*) or 'raising' (of the foot).

Many Latin and modern writers have introduced great confusion into metrical nomenclature by directly interchanging the meaning of the words *arsis* and *thesis*. (See *arsis*.) An uninterrupted succession of feet constitutes a colon or series, and the name *line* or *verse* is given to a colon, cola, or period, if written in one line. In accentual poetry, as in English, and other modern languages in which the syllabic accent is chiefly a stress of the voice, the rhythmic lotus regularly coincides with the syllabic accent, and the relative length of time taken in pro-

nouncing a syllable is almost entirely disregarded. In the poetry of the Greeks, Romans, Hindus, and other nations in whose languages the syllabic accent was chiefly a matter of tone or pitch, quantity—that is, the length of time taken in pronouncing each syllable—determined the rhythm. In Greek and Roman rhythmic and metrics a unit of time is assumed, called a *primary or fundamental time or mora*, or specifically a *time*, and this is regarded as the ordinary or normal short (marked $\cup$), and expressed in verbal composition by a short syllable. The ordinary or normal long (marked —) is equal to two times or more, and is expressed by a long syllable. Metrical classification of such feet is based upon metrical *magnitude*—that is, on the length of the foot as measured in mora or times, each long being reckoned as two shorts—or on the *pedal ratio*—that is, the proportion of the number of times in the thesis to that in the arsis.

From long to long in solemn sort

Coleridge, Metrical Feet.

12. In music: (a) A drone-bass. (b) A chorus or refrain; a burden. (c) In organ-building: (1) The part of a pipe below its mouth. (2) A measure or name used in denoting the pitch of stops. The standard of reference is the length of an open pipe belonging to the second C below middle C. A unison stop is called an 8-foot stop, because in this case the pipe is about 8 feet long. Similarly, an octave stop is called a 4-foot stop; a double or suboctave stop, a 16-foot stop, etc. (See *stop*). The usage has been extended to the designation of the pitch of particular tones and of instruments. Thus, the second C below middle C is called 8-foot C, and all the tones in the octave above it 8-foot tones, or tones in the 8-foot octave, while the first C below middle C is called 4-foot C, etc. Thus, also, the piccolo is called a 4-foot instrument, because its tones are an octave above the notes written.

Washing of feet, a ceremony in the Roman Catholic, Greek, Russian, and some other churches, as those of the Dunkers, Winebremerians, etc., in commemoration of Christ's washing of the feet of his disciples after the last supper (John xiii. 4-17), both as a symbol of spiritual cleansing and as a lesson to them of humility and good will. The washing of others' feet, for their relief from the effects of exposure in a hot climate with but slight or no covering, has always been a common practice in Oriental countries, generally performed by menials; and religious ideas have often been associated with the practice. In the Roman Catholic Church the ceremony is observed on Thursday of Holy Week. The pope washes the feet of thirteen poor priests, and the principal priests or prelates of the Roman Catholic churches wash the feet of twelve poor persons. The ceremony is also called *mandatum* or *maundy*. See *Maundy Thursday*.

Overcometh the winter with driving the *foote-ball*,
Forgetting labour and many a grievous fall.
Alex. Barclay, quoted in Strutt's Sports and Pastimes, [p. 169].

2. A game played with such a ball by two parties of players on a level plot of ground, at each end of which is a goal through or beyond which the players strive to drive the ball. There are various ways of playing the game, the two most commonly recognized being the "Association" and the "Rugby" game, the latter either in its original form or as played in America in a modified form. The field is 330 feet long by 160 wide, and in the middle of each end is a goal formed of two upright posts, in the Rugby game 18½ feet apart with a cross-bar 10 feet above the ground, and in the Association game 24 feet apart with a cross-bar 8 feet from the ground. There are 11 players on each side (in the Rugby game sometimes 15), divided into *rushers* and *backs*; the special object of the former being to check their opponents and to rush or push forward the ball in a body, and of the latter to kick or run with the ball. The two sides cast lots for choice of goals, that side not winning the choice having the ball when the game is begun. In the Rugby game the players can kick, run with, or throw the ball (but not throw it forward toward their opponents' goal); in the Association game they can only kick it. The playing is begun by *kicking off* the ball from midway between the goals, and the players strive to force the ball through or beyond their opponents' goal. In the Association game, to win a goal the ball must be kicked through the goal below the cross-bar, and the side securing the largest number of goals wins the game. In the Rugby game scoring is by *goals*, *touch-downs*, and *safety touch-downs* or *saftens*. A goal is won by kicking the ball through or above the goal-posts over the cross-bar; a touch-down, by carrying the ball behind the goal and then touching it to the ground, which gives the player a *try*—that is, the right to carry the ball out in front of the goal and try to kick a goal; a safety touch-down or *safty*, by forcing one's opponents to touch the ball to the ground behind one's own goal. The play continues for a certain length of time, generally an hour and a half, divided into two parts by a short intermission, at which time the players change sides. Foot-ball is an ancient game, probably introduced into Great Britain by the Romans, though the first distinct mention of it is in Fitzstephen's History of London, about 1175.

for-1. [ME. *for-*, < AS. *for-* = OS. *far-* = OFries. *for-* = D. ver. = MLG. *vor-*, LG. *for-* = OHG. *fir-*, *far-*, MHG. *ver-*, G. *ver-* = Icel. *for-* (rarely *fyr-*, *ir-*) = Sw. *för-* = Dan. *for-* = Goth. *fra-*, *faur-*, *fair-*: a prefix involving several different developments (oppositeness, negation, difference, change, deterioration) of the radical meaning 'before,' and varying in its force accordingly; akin to *for*, *fore*¹, etc., and ult. to the L., Gr., and Skt. forms cited under *for*. The three Goth. forms *faur-*, *fair-*, *fra-*, are phonetically near to Gr. *πρό*, before, beside, *πρό*, around, and *πρό*, before, respectively. See further under *for*, *prep*. In some words *for*¹ has become confused with *for*², equiv. to *fore*¹; e. g., *forego*² for *forgo*¹, *forward*¹ for *foreward*¹, *forward*² for *foreward*², etc. See *for*³.] An inseparable prefix in words of Middle English and Anglo-Saxon origin, formerly attachable at will to any verb admitting of the qualification conveyed by this prefix, but no longer used or felt as a living formative. In Middle English and Anglo-Saxon it conveyed various notions, as oppositeness, negation, difference, change, deterioration, etc., often intensify, these notions being traceable in the modern words; thus, *for* is negative in *forbid*, *forwear*, negative or pejorative in *forpeak*, etc., alternative in *forshape*, etc., intensive in *forlorn*, *forweary*, *forwounded*, *forwent*, etc. From its intensive use in participial forms of verbs it came to be used also as an intensive prefix to adjectives, as in *forblack*, very black, *forbly*, very dry, etc. (See the etymology, and compare *for*³). This prefix, once extremely common, has not only ceased to be used in forming new words, but most of the old words containing it have become obsolete, *forbear*¹, *forbid*, *forget*, *forgive*, *forgo*¹, *forake*, *forwear*, and *forlorn* in its adjective use being the only ones now in familiar use. Only the principal Middle English words with this prefix are entered in this dictionary.

Foraminifera (fō-rām-in'ī-fē-rā), n. pl. [*NL.*, neut. pl. of *foraminifer*: see *foraminiferous*.] An order of *Rhizopoda*, belonging to the subkingdom *Protozoa*, furnished with a shell or test, simple or complex, usually perforated by pores (foramina), whence the name. The shell may be composed of horny matter, or of carbonate of lime secreted from the water in which they live, or may be fabricated by sticking together extraneous matters, such as particles of sand. Owing to the resemblance of their convoluted chambered shells to those of the nautilus, they were at first reckoned among the most highly organized mollusks. In reality they are among the simplest of the *Protozoa*. The body of a foraminifer is composed of granular, gelatinous, highly elastic sarcode,

Diagrams of Foraminifera. A, monothalamian; B, C, polythalamian; D, horizontal, and E, F, vertical sections of the helicoid forms.

which not only fills the shell, but passes through the perforations to the exterior, there giving off long thread-like processes, called pseudopodia, interlacing one another so as to form a net like a spider's web. Internally the sarcode-body exhibits no structure or definite organs of any kind. A nucleus, which at one time was believed to be absent, has been discovered in these organisms. A remarkable formation known as *nummulitic limestone* receives its name from the presence of large coin-shaped foraminifers, generally about as large as an English shilling. The name is based on the French *foraminifères* of A. d'Orbigny, who regarded these organisms as cephalopodous mollusks, and named them from the foramina by means of which the cells communicate. He divided them into *Helicostegues* (with the subdivisions *H. nautiloides*, *ammonoides*, and *turbinoides*), *Stichostegues*, *Enallostegues*, *Agathidiscus*, and *Entonostegues*, terms corresponding to *Helicostega*, *Stichostega*, *Enallostega*, *Agathidiscus*, and *Entonostega*. The most approved recent classification of the *Foraminifera* is by H. B. Brady, who divides the order into the families *Gromiidae*, *Miliolidae*, *Astrotrichidae*, *Lituolidae*, *Trochammina*, *Chilostomellidae*, *Lagenidae*, *Globigerinidae*, *Rotulidae*, and *Nummulinidae*. The problematic fossil of the Laurentian rocks of Canada, named *Eozoon canadense*, has been referred to the order, but its foraminiferal nature has been denied by most recent naturalists. By some authors the *Foraminifera*, under the name *Reticularia*, are regarded as a class of protozoans, and divided into 10 orders, corresponding with the above-named families. *Thalamophora* is a third name of these organisms.

8. In physics: (a) Strictly, the immediate cause of a change in the velocity or direction of motion of a body; a component acceleration, due to a special cause, paired with the mass of the moving body; a directed or vector quantity of the dimensions of a mass multiplied by an acceleration or rate of change of a velocity, this quantity representing the instantaneous effect of any definite cause affecting the motion of a body. The distinct mechanical apprehension of *force* is modern. Archimedes discovered the elements of the theory of the pressures upon bodies at rest, but it was not until the seventeenth century that, by the labors of mathematicians from Galileo to Newton, the general mode in which bodies move became sufficiently understood to give a perfectly definite meaning to the word, and indeed the development of the idea has not yet ceased. A particle infinitely remote from others, so that no special influences would work upon it, would retain a velocity constant in amount and direction. The effect of any cause is to produce an alteration of velocity; and when this happens the cause is said to exert *force* upon the particle. The explanation of what is meant by a *force* is dependent upon the mechanical notion of the composition of motions, according to which, for example, if a man walks on the deck of a ship, his motion relatively to the sea is said to be compounded of his motion relatively to the ship and of the motion of the ship relatively to the sea. In general terms, if a particle which at any instant is at any point of space, A, has a partial or component motion which at the end of a second would carry it to a point B, and at the same time has another component motion which would carry it in the same time to a point C, the result of the two motions will be that it is carried to a point D, such that ABCD is a parallelogram, as in the figure. It necessarily follows that accelerations of velocity are compounded in a similar manner; namely, if a particle is at any instant under such circumstances that according to a law of nature its velocity undergoes the acceleration represented by the line AB, while at the same time, owing to other circumstances, it undergoes another alteration represented by the line AC, these two alterations are compounded by the same principle; and if the point D completes the parallelogram ABCD, the alteration represented by the diagonal AD is the result of compounding the two other alterations. This is called the principle of the *parallelogram of forces*. The polygon of

forces is merely a complicated application of the same principle, according to which, if the velocity of a particle experiences several simultaneous alterations, represented by all the successive sides but one of a polygon taken in one continuous order, the result is an alteration represented by the last side in the direction of the last point from the first. The operation of thus compounding several simultaneous changes of velocity is termed the *composition of forces*, the partial changes are termed *components*, and the result of the operation the *resultant*. When a body is under the influence of a *force*, it has what is called a tendency to motion, which consists in its actually receiving, under all circumstances, in each unit of time, so long as the *force* acts, a motion in a definite direction and of fixed amount, which motion is compounded with the motion already impressed upon the body, together with the effects of other *forces* to which it may be simultaneously subject. Thus, every body at the surface of the earth, in consequence of the *force* of gravity, actually receives an increase of downward velocity at the rate of 32 feet per second; and if it does not fall on the whole, it is because it is at the same time, in consequence of the elastic compression of the support upon which it rests, projected upward with the same increase of velocity per second. The component *forces* when due to definite causes are also called *impressed forces*; the resultant of all of them is called the *effective force*. By the same principle, any alteration of velocity may be separated into several, and this is called the *resolution of forces*, although no part of the components may represent the total effect of any definite cause. When a velocity or alteration of velocity is thus resolved into three components at right angles to one another, each is termed the *resultant resolved* in that direction. By the law of action and reaction, whenever a body has its velocity altered owing to any cause, some other body has its velocity altered in precisely the opposite direction. The alterations are not of equal magnitude, but when each is multiplied by a quantity which is constant for each portion of matter undergoing an alteration of velocity—this constant being termed the *mass* or *amount of matter*—the two products are equal. All alterations of velocity take place gradually and continuously. The rate of change of velocity, together with its direction, coupled with or multiplied by the mass of the body undergoing the change of motion, is a *force*, properly so called, or *accelerating force*. According to this, the accepted view of the matter, *force* is nothing occult, but is simply the product of a mass by a component acceleration due to a definite position relatively to another body or to some other circumstance. Nevertheless, many writers regard *force* as an occult something which causes or explains the alterations of the velocities of bodies; and no writers who employ the word at all altogether avoid the use of phrases which seem to bear such a meaning. An *impulsive force* is the amount of a sudden finite change of motion multiplied by the mass of the moving body; it is not supposed there really are any such forces, but it is occasionally convenient to regard forces as impulsive. A *force* is defined by its intensity or amount, its direction, its point of application, and the time at which it exists. The point of application of a *force* is the particle which is immediately and directly affected by it.

Force, then, is of two kinds, the stress of a strained adjoining body, and the attraction or repulsion of a distant body.

W. K. Clifford, Lectures, II. 26.

Loosely—(b) Any mechanical cause or element. This use of the word, which dates from before the development of clear conceptions of dynamics, is now obsolete with physicists except in special connections. Older writers speak of momentum and even of inertia as a *force*. Such expressions, and even the reference to pressure as *forces* (except in the phrase *centrifugal force*), are now obsolete. On the other hand, accelerations are still frequently called *forces*. Energy is now rarely termed *force*, except in the phrase *living force* (*vis viva*): thus, in technical language, it is no longer correct to speak of the *force* of the waves or of a cannon-ball, but of their *power* or *energy*. Special affections of matter giving rise to *force*, such as elasticity and electrification, are frequently called *forces*, although they are properly powers. Other phenomena, such as electricity, light, etc., are still loosely called *forces* by some technical writers.

If we accept *force* as the dynamic aspect of existence, the correlate of matter, we have a firm, speculative foundation for the first law of motion, which expresses in an intelligible formula both the constancy of existence and the varieties of its distribution.

B. *Centrifuga*, a term introduced by Huygens in 1673. The principle had been vaguely employed by the ancient astronomer Aristarchus to explain why the moon does not fall to the earth.] (a) Properly, a quantity of the dimensions of a *force*, the product of the mass of a particle

moving along a curved path into a component accelerative elongation of the radius of curvature of the path (nd^2/dt^2), due to the inertia of the particle; inertia considered as the cause of such acceleration. If, while a wheel is revolving uniformly, a particle is suddenly released from its periphery, this particle will (in the absence of forces) fly off on a tangent without change of velocity. The path of the particle, considered as relative to the revolving wheel, is an involute of the circle. Hence, at the instant of release the direction of the relative motion of the particle is radial to the wheel, and it can be shown that, while the particle of this motion would be null at that instant, its acceleration would be equal to the square of the velocity of the particle divided by the radius of the wheel. It is simplest to say that this accelerative elongation of the radius vector always takes place, and that if, notwithstanding, the particle does not leave the wheel, it is because the centrifugal acceleration due to inertia is precisely balanced by a centripetal acceleration due to the forces which hold the particle in place. But the centrifugal force does not at all depend upon the principle of action and reaction, if a particle moves upon any curved path whatever, any infinitesimal part of this path is occupied by a circle, and inertia will produce the same accelerative elongation of the radius vector from the center of this circle as before; and this radius vector is the radius of curvature of the path. As thus defined, the centrifugal force is not a true force, since it results from the resolution of the motion into a radial and a circular part, while the principle of the parallelogram of forces (see def. 8 (a)) forbids such a resolution of forces proper. Thus, if a particle moves in a circular orbit about an attracting center, since the radius of curvature is constant, the centrifugal force must be balanced by a precisely equal and opposite attracting force. But a body which was really subjected to two equal and opposite forces would move as if subjected to none—that is, not in a circle, but in a straight line. The fact is that the only influences to which the body is subjected are *I*, its inertia, and *A*, the attraction—that is, $I + A$. The centrifugal force is equal to $-A$, and balances the attraction, but it is a part of the inertia, the remainder of which is $I + A$. (b) In an erroneous use, a repulsive force causes a body to begin to fly away from the center of revolution. Writers on attractions sometimes so use the word. (c) A fictitious force repelling every particle of the earth from the axis by an amount equal to the centrifugal force in sense (a). With this hypothesis, and supposing the earth not to rotate, the statical effects are the same as in the actual case; but the dynamical effects are different. (d) As used by many high authorities, the reaction of a moving body against the force which makes it move in a curved path. In this sense it is a real force. It does not, however, act upon the moving body, but upon the deflecting body; and, far from giving the former a tendency to fly away from the center, it is but an aspect of that stress which holds it to the curved trajectory. The centrifugal force in sense (a) may be regarded as that in sense (d) transferred from the deflecting to the deflected bodies. (These differences of meaning explain the apparently conflicting views of writers.)

When I was about nine years old I was taken to hear a course of lectures, given by an itinerant lecturer in a country town, to get as much as I could of the second half of a good, sound, philosophical omniscience. . . . "You have heard what I have said of the wonderful centripetal force, by which Divine Wisdom has retained the planets in their orbits round the Sun. But, ladies and gentlemen, it must be clear to you that if there were no other force in action, this centripetal force would draw our earth and the other planets into the Sun, and universal ruin would ensue. To prevent such a catastrophe, the same wisdom has implanted a centrifugal force of the same amount, and directly opposite," &c. I had never heard of Alfonso X. of Castile, but I ventured to think that if Divine Wisdom had just let the planets alone it would come to the same thing, with equal and opposite troubles saved. *De Morgan*, Budget of Paradoxes, p. 431.

Deviating force and centrifugal force are but two different names for the same force, applied to it according as its action on the revolving body or on the guiding body is under consideration. *Rankine*, Applied Mechanics, § 638.

The student cannot be too early warned of the dangerous error into which so many have fallen, who have supposed that a mass has a tendency to fly outwards from a centre about which it is revolving, and therefore exerts a centrifugal force which requires to be balanced by a centripetal force. *Tait*, Encyc. Brit., XV. 682.

Although the earth is really revolving about its axis, so that all problems relating to the relative equilibrium of the earth itself and the bodies on its surface are really dynamical problems, we know that they may be treated statically by introducing, in addition to the attraction, that fictitious force which we call the centrifugal force. *Stokes*, On Attraction, § 1.

Non-conservative forces, forces which depend upon the velocities of the bodies between which they act. Such forces are alone capable of setting up rotations. Friction and viscosity are examples of such forces, and these are explained by physicists as the result of chance encounters, etc., among almost innumerable molecules. Strength, etc. (see power); efficacy, efficiency, potency, cogency, virtue; Force, Compulsion, Coercion, Constraint, Restraint.** Among these force is the most general. *Compulsion* and *coercion* are generally more active, pushing one onward; *constraint* and *restraint* less active, the last being simply a holding back. The first three could be applied to a person's treatment of himself only by a lively figure; *constraint* and *restraint* express equally self-control and control of others. *Constraint* upon one's self is much harder than *restraint*.

By force they could not introduce these gods;
For ten to one in former days was odds.
Dryden, Abs. and Achit., l. 122.

Give you a reason on compulsion! If reasons were as plenty as blackberries, I would give no man a reason upon compulsion.

2. In Great Britain, a designation still retained for some large tracts of land or districts formerly but not now covered with trees or constituting royal forests (see below), especially such as have some of the distinctive characteristics or uses of wild or broken woodland, as the Forest of Dean in England or some of the deer-forests of Scotland.

Wedgwood, Dict. Eng. Etymology.

3. In *Eng. law*, and formerly also in *Scots law*, a territory of woody grounds and pastures privileged for wild beasts and fowls of chase and warren to rest and abide in, generally belonging to the sovereign, and set apart for his recreation, or granted by him to others, under special laws, and having officers specially appointed to look after it; a hunting-preserve maintained at public expense for royal or aristocratic use: specifically called a *royal forest*. Such forests were once very numerous, and often of great extent; but most of them have been disafforested, and those still kept up are now chiefly used as public pleasure-grounds.

Forests are waste grounds belonging to the king, replenished with all manner of chase or venery; which are under the king's protection, for the sake of his recreation and delight.
Blackstone, Com., I. viii.

It may happen that the wastes of two or more manors adjoin, and sometimes the common, or moor, or whatever it may be called, is a *royal forest*—that is, a hunting preserve created since the Conquest. The presence of trees, I need hardly say, is not required to make a forest in this sense. The great mark of it is the absence of enclosures.
F. Pollock, Land Laws, p. 40.

Charter of the Forest. See *charter*.—**Drift of the forest.** See *drift*.—**Forest-bred group.** In *Eng. geol.*, a division of the so-called *crag* (which see). It is but a few feet in thickness, but is exposed for many miles along the coast of Norfolk. It contains a great variety of organic remains, among which are cones of trees, leaves of various plants, land-shells, and bones of mammalia, birds, and reptiles.—**Ordinance of the forest.** See *ordinance*.

—**Pure forest**, a forest consisting wholly of one kind of trees: in contradistinction to a *mixed forest*, in which the trees are of several kinds.—**Right of forest**, the right or franchise of keeping, for the purpose of venery and warren, all animals pursued in field sports in a certain territory or precinct of woody ground and pasture.—**Submarine forest**, a geological phrase applied to beds of impure peat, consisting of roots, stems, and branches of trees, etc., occupying the sites on which they grew, but which by change of level are now submerged by the sea. Such submarine forests do not contain any trees that are not found growing at the present time. They belong to the recent or Quaternary period, and occur above the boulder-clay. They have been traced for several miles along the margins of the estuaries on the north and south shores of the county of Fife in Scotland.—**Syn. Forest**, *Wood*, *woods*, *Woodland*, *Grove*, *Chase*, *Park*. Of some of these words the earlier and the later uses differ very much. *Forest* implies a large body of trees growing naturally, or the tract considered as covered with trees. It formerly always implied the presence of animals of the chase. *Wood* or *woods* is like *forest*, except in being smaller. *Woodland* differs from *woods* in emphasizing the land or tract upon which the trees stand. A *grove* is a cluster of trees not sufficiently extensive to be called a *wood*. A *chase* is, in strictness, open *woods* of indefinite extent, especially set apart for hunting; but the word survives as applied to places from which the animals have disappeared. A *park* is primarily an inclosure of considerable size; the word is now often applied to a piece of land set apart for public recreation and more or less elaborately adapted by art to that end, as *Regent's Park* in London and *Central Park* in New York.

He (William the Conqueror) ordered whole villages and towns to be swept away to make forests for the deer. Not satisfied with sixty-eight royal forests, he laid waste an immense district to form another in Hampshire, called the *New Forest*.

To show Sir Arthur's deer. *Tennyson, The Brook*.

form (fôr'm), *n.* [Early mod. Pg. It. *forma* = D. *form* = MHG. *forme*, G. *form* = Icel. *formr* = Dan. Sw. *form*, < L. *forma*, shape, figure, image, outline, plan, mold, frame, case, etc., manner, sort, kind, etc., ML. also a bench, choir-stall, grade in a school, etc. (with many other meanings). There is no ground for the attempted distinction, in pronunciation and spelling, between *form*, shape, etc., and *form* (spelled *fourn* in Bailey), a bench, etc.] 1. The external shape or configuration of a body; the figure, as defined by lines and surfaces; external appearance considered independently of color or material; in an absolute use, the human figure; as, it was in the *form* of a circle; a triangular *form*; the *form* of the head or of the body; a beautiful or an ugly *form*.

2. Specifically, in *crystal*, the complex of planes included under the same general symbol. Thus in the isometric system the most general form is the hexoctahedron, embracing forty-eight similar planes. In the triclinic system a form, even in the most general case, includes only two similar planes, and is called an *open form*, since it does not represent an inclosed solid or closed *form*; similarly, the two basal planes in the orthorhombic system constitute a *form*.

3. Attractive appearance; shapeliness; beauty. [Archaic.]

He hath no *form* nor comeliness. Isa. liii. 2.

4t. A costume; a special dress: as, a blue silk *form*.

5. A mold, pattern, or model; something to give shape, or on or after which things are fashioned: as, a hatters' or a milliners' *form*; a *form* for jelly.—6. In *printing*, an assemblage of types secured in a chase for stereotyping, or of either types or plates for printing. A *form* may consist of one page or of many pages. For stereotyping, no particular order of arrangement is necessary; for printing, the pages are arranged in such order that in folding the printed sheet they will fall in regular sequence. In book-printing, before the general use of steam-presses, two forms (see *inner* and *outer form*, below) were usually required for a sheet, one being separately printed on each side; now a single form frequently comprises a whole sheet, the paper being turned end for end for printing the second side. Large newspapers, however, still require two forms. In this sense often spelled *forme* in Great Britain.

7. In *milit. engin.*, same as *gabion-form*. See *gabion*.—8. In general, arrangement of or relationship between the parts of anything, as distinguished from the parts themselves: opposed to *matter*, but not properly to *substance* (unless it be the intention of the writer to identify substance with matter). Thus, to say that the soul was immaterial was formerly considered the same as to say that it was a *form*. With the older writers *form* is often synonymous with *essence*, and has generally lofty associations (thus, the shape of a living being, considered as its perfection, was called its *form*, while that of a lifeless thing was called its *figure*, but not its *form*), and these ideas clinging to the word in the minds of later writers, as Kant. But with many modern writers the conception is of something imposed upon the thing from without, and distinct from its life and essence. In metaphysics *form* denotes a determination, a specializing element, that constituent of a thing by virtue of which it is the kind of thing that it is. In the Platonic philosophy the *form* is the exemplar according to which a thing is made, or the mold, as it were, in which the thing is cast. In the Aristotelian philosophy *form* is the developed actuality, matter the undeveloped potentiality; *matter* is that element by virtue of which the thing is, *form* is that by which it is as it is—that is, the nature or essence of the thing. In Bacon's philosophy the *true form* is the physical structure or constitution of anything. In Kant's philosophy *form* is that element of an object which is imported into it by the mind: opposed to the *matter*, which is given in sense. For various other metaphysical applications of the term, see phrases below.

The figure comprehendeth the shape of things that have no life, as the facion of the elemente, of trees, of flounders, of an house, a shippe, a cote, and soche like. The *fourme* containeth the portraiture of all living thinges, as the very livelye image of man, of an horse, or a lion, as we call a man well favoured or hardie favoured.

Sir T. Wilson, Rule of Reason (1551).
Though I shall for brevity's sake retain the word *form*, yet I would be understood to mean by it, not a real substance distinct from matter, but only the matter itself of a natural body, considered with its peculiar manner of existence, which I think may not inconveniently be called either its specific or denominating state, or its essential modification; or, if you would have me express it in one word, its stamp. Boyle, Origin of Forms.

Of a beautiful landscape, melody, or poem, the blending of unity with variety appears not only in the grouping of Sense-Elements ("form" in the narrow meaning), but also in that of the represented content or signification of these. J. Sully, Outlines of Psychol., p. 586.

In a phenomenon, I call that which corresponds to the sensation it matter; but that which causes the manifold matter of the phenomenon to be perceived as arranged in a certain order I call its *form*. Kant, Critique of Pure Reason (tr. by Max Müller), p. 18.

The distinction above specified is employed by Aristotle in his exposition of the soul. The soul belongs to the category of substance or essence (not that of quantity, quality, etc.); but of the two points of view under which essence may be presented, the soul ranks with *form*, not with *matter*—with the actual, not with the potential. Grote, Aristotle, p. 457.

Time and space are not given in sensation. They are not the sensational matter of perception, but something that "makes it possible for us to represent all parts of that matter as arranged in certain relations to each other"; and this we may fairly call the *form* of perception. E. Caird, Philos. of Kant, p. 234.

11. Fixed order or method; systematic or orderly arrangement or proceeding, as to either generals or particulars; system or formula: as, the *forms* of civilized society; a *form* of words or of prayer; a rough draft to be reduced to *form*; a document in due *form*.

16. High condition or fitness for any undertaking, as a competition, especially a physical competition; powers of competing.

In the language of the turf, when we say that a horse is in *form*, we intend to convey to our hearers that he is in high condition and fit to run. So, again, the word is used in still another sense; for we speak of a horse's *form* when we wish to allude to his powers on the turf, as compared with other well-known animals. Thus, if it be supposed that two three-year-olds, carrying the same weight, would run a mile and a half, and come in abreast, it is said that the *form* of one is equal to that of the other. J. H. Walsh, The Horse, vi.

The substantial form has four marks: it does not directly affect the senses; it has no variations of degree (though this was disputed); it is good and perfect; it is the principle or origin of the properties and operations of that to which it pertains. Much use was made by the medieval logicians of the doctrine of substantial forms, and thus the absurdity of trying to explain the properties and operations of things by means of mere abstract statements was put in a strong light, which the conflict with the real explanations of science soon heightened. Thus, if the Newtonian law of gravitation were merely a transformation of Kepler's laws, and implied nothing further, it would be of the nature of a substantial form; but in point of fact it predicts the various lunar equations, the planetary perturbations, the precession of the equinoxes, the tides, and the figure of the earth.—Theory of forms, the theory of the changes of algebraic forms due to linear transformations of their variables; especially, the theory of invariants, reciprocants, etc.—To take form, to assume a definite shape, appearance, or order; become definite and clear: as, the conception gradually took form in his mind.—Syn. 1. =Syn. 3. *Forsake*, *Desert*, *Abandon*, *Relinquish*, *Quit*. These all express the idea of giving up or leaving. The first three are strong expressions, ordinarily conveying the idea of loss to that which is left; the fourth, on the other hand, suggests loss to him who *relinquishes*. *Forsake* is chiefly applied to leaving that by which natural affection or a sense of duty should or might have led us to remain: as, to *forsake* one's home, friends, country, or cause; a bird *forsakes* its nest. In the passive it often means left desolate, forlorn. *Forsake* may be used in a good sense: as, the color *forsakes* her cheeks; even hope *forsakes* him. *Desert* may be synonymous with *forsake*, but in the active voice it usually implies a greater degree of culpability, and often the infringement of a legal obligation: as, to *desert* one's family, regiment, ship, colors, post. Such was the original use of the word. *Abandon* most fully expresses complete and final severance of connection: as, to *abandon* a ship or a hopeless undertaking; to *abandon* hope or property. Sometimes, but not so often as *desert* or *forsake*, it implies the dropping of all care or concern for an object: as, to *abandon* one's offspring. *Relinquish* is not used with a personal object: as, to *relinquish* a claim, land, effort. (See lists under *relinquish* and *abandon*.) To *quit* is to leave finally or hastily, or both.

II. *n.* 1. Any rock or mineral, or any mineral substance, whether of an organic or of an inorganic nature, dug out of the ground.—2. Specifically, in later geological and mineralogical use, anything which has been buried beneath the surface of the earth by natural causes or geological agencies, and which bears in its form or chemical composition the evidence that it is of organic origin. Thus, the shell of a mollusk may be preserved unchanged, in both form and chemical composition; or, while retaining its original form, it may have been converted into silica; or it may have disappeared entirely, leaving only a cast as evidence of its former existence; or there may remain only a mold of its interior, formed after the soft parts had entirely decayed: in any of these cases, the specimen or fragment of rock which thus shows by its form that it, either wholly or in part, belonged to an organic body, or that its configuration resulted from the presence of something having had an organized existence, would be properly called a *fossil*. Even the rocks showing traces of trails, footprints, bored cavities, or other evidences of contact with organic life, are usually designated as *fossils*. The bones or other remains of species now living on the earth, if buried by any recent catastrophe, such as a flood or landslide, would not, as a general rule, be designated as *fossil*, but would be called *recent*. If, however, such an entombment took place in prehistoric times, the term *fossil* would be by most geologists be used in describing the occurrence in preference to *recent*.

3. Hence, figuratively, one who or something which is antiquated, or has fallen behind the progress of ideas; a person or thing of superannuated or discarded character or quality: as, a curious literary *fossil*.—*Dyestone fossil*. Same as *dyestone ore*. See *dyestone*.

The tarsus also may be expanded, but generally it is small and sometimes entirely absent; the whole leg is stout and has great muscular force. The fossorial form is most commonly seen in the anterior legs: it is well exemplified in the mole-cricket and in many *Coleoptera*.

—**Hero's fountain**, a pneumatic apparatus in which the elastic force of a confined body of air, increased by hydraulic pressure and reacting upon the surface of water in a closed reservoir, produces a jet which may rise above that surface to a height equal to the effective height of the pressing column: named from Hero of Alexandria, to whom the invention of the instrument is ascribed. It consists essentially of an open basin, and two closed reservoirs at different levels below the basin. A tube connects the upper parts of both the reservoirs. Another tube connects the bottom of the basin with the lower part of the lower reservoir. A detachable tube with a jet-nozzle at its upper end passes through the center of the basin and down into and very nearly to the bottom of the higher reservoir. The detachable tube being removed, the higher reservoir is partly filled with water through the opening; then the tube is replaced, and water poured into the basin. This water, running down into the lower reservoir, forces the air from the latter up into and increases the pressure in the higher reservoir, displacing the water therein and forcing it through the detachable tube in the form of a jet. This ejected water falls into the basin and thence passes to the lower reservoir, and thus the action continues till nearly all the water in the higher reservoir has been discharged through the jet.—**Steam-fountain**, a fountain in which the liquid is raised by the pressure of steam upon the surface in a reservoir.—*Syn.* 1 and 2. Several phalansteries were established in France and the United States; but it was not found practicable to carry out his plans fully in any of them, and their existence was brief. Also called *associationism*.

The most skillfully combined, and with the greatest foresight of objections, of all the forms of socialism, is that commonly known as *Fourierism*.

The fennecs are small African foxes, closely allied to *Vulpes* proper, but commonly placed in a different genus, *Fennecus*. (See out under *fennec*.) Resembling these externally, but structurally different, is the African fox, *Megaloglossus* or *Otocyon* (as *O. montanus*), a generalized form representing a different subfamily *Megaloglossini*. The tail of the fox is called the *brush*. In the English Bible the word *fox* refers in some places to the jackal, in others to the fox. See *reynard*.

4. In *math.*: (*a*) In *arith.*, one or more aliquot parts of a unit or whole number; the ratio between any two numbers. The number of parts into which the unit is divided is termed the *denominator*, and the number of these parts taken is termed the *numerator*. The denominator is commonly written below, and the numerator above, a horizontal or diagonal line; thus, $\frac{3}{4}$, $\frac{5}{6}$. Fractions written in this form are called *common* or *vulgar fractions*. (See *decimal*.) A *proper fraction* is one whose numerator is less than its denominator; an *improper fraction*, one whose numerator is greater than its denominator; as, $\frac{3}{4}$, $\frac{5}{4}$. A *simple fraction* expresses the ratio between two whole numbers: as, $\frac{3}{4}$; a *compound* or *complex fraction* expresses the ratio between fractions (or mixed numbers), or between a fraction (or mixed number) and a whole number: as,

$$\frac{\frac{1}{2}}{\frac{3}{4}}, \frac{\frac{2}{3}}{\frac{1}{2}}, \frac{\frac{3}{4}}{1 + \frac{1}{2}}, \frac{2}{\frac{1}{2}}$$

Compound or complex fractions can always be reduced to simple fractions. A *compound fraction* is also defined as a fraction of a fraction. A fraction is said to be reduced to its lowest terms when the numerator and denominator contain no common factor.

The *fraction* which denotes the ratio of the map to the true area is sometimes termed the *representative fraction*.

A current of water let in upon that end washes the poorer portions and impurities downward, toward or out of the lower end, the heavier and richer portions of the ore remaining at the top. When the slime is thus cleaned and distributed, the table is revolved on its supporting axes, and the contents are dumped into assorting-boxes beneath, from which the ore is taken to be submitted to other operations suited to its character. This operation of sorting is called *framing* or *ragging*, and there were formerly various modifications of the process in use in Cornwall, England, where, however, the simplest form of ore-dressing has been nearly superseded by improved methods and machinery. See *buddle* and *percussion-table*.

The specimen of the silver coin given in the cut weighs about 217 grains, and was worth about one third as much as the gold coin. II. n. One of an order of mendicant friars founded by St. Francis of Assisi, Italy, authorized by the pope in 1210 and more formally ratified in 1223. In addition to the usual vows of pov-

erty, chastity, and obedience, special stress is laid upon preaching and ministry to the body and soul. Under various names, such as Minorites, Barefooted Friars, and Gray Friars, the order spread rapidly throughout Europe; among its members were Alexander of Hales, Duns Scotus, Roger Bacon, Jean, Pope Sixtus V. and Clement XIV., and other eminent men; and the order was long noted for its rivalry with the Dominicans. Differences early arose in regard to the severity of the rule, which culminated in the fifteenth century in the division of the order into two great classes, the Observantines or Observants and the Conventuals; the former follow a more rigorous, the latter a milder rule. The general of the Observantines is minister-general of the entire order. The order has been noted for missionary zeal, but suffered considerably in the Reformation and the French revolution. The usual distinguishing features of the garb are a gray or dark-brown cowl, a girdle, and sandals.

3. A free, unconditional grant; a free privilege or franchise. [*Rare.*]**—4.** In *math.*, capability of displacement in space.—**Bird of freedom.** See *bird†*.—**Degree of freedom**, in *math.*, an independent mode in which a body may be displaced. Thus, a wheel the axis of which is fixed, or a roller which is compelled to roll on the ground without sliding or turning, has but one degree of freedom—that is, it can move only forward or back. If it can turn without sliding, or slide without turning, either in the direction of its rolling or in that of its axis, it has two degrees of freedom; if it is capable of all these motions, it has four degrees of freedom. If one end of it can rise above the surface of the ground, it has five; if both ends can leave the ground, it has six degrees of freedom and is perfectly free.—**Freedom of repeal**, a free, unconditional recall.

I kiss thy hand, but not in flattery, Cæsar;

Deairing thee that Publius Cimber may

Have an immediate *freedom* of repeal.

Shak., *J. C.*, iii. 1.

Freedom of the will. See *will*.—**Syn.** *Liberty, Independence*: scope, range, play, swing, latitude. The first three words are sometimes used as synonyms, but they are clearly distinguishable. *Freedom* is the most general in its application. *Liberty* is commonly used where reference is made to past or possible physical confinement or restriction: as, the prisoners were set at *liberty*. *Freedom* is used where emphasis is laid upon

large opportunity given for the exercise of one's powers: as, the *freedom* of country life; or where the previous or possible restriction has been or is legal or moral: as, the slave was given his *freedom*; he expressed his views with *freedom*. *Liberty* is more often public; *freedom*, personal and private. *Liberty* has more in mind protection from external constraint or from the aggressions of power; hence, in civil affairs, *liberty* is *freedom* as outlined and protected by law. *Independence* is more exact, expressing not only self-direction but exemption from control, and even lack of connection. There may be *liberty* without *independence*, as in the case of a self-governed colony, and there may be *independence* without *liberty*, as in the case of a despotic monarchy.

Ye winds, that wafted the Pilgrims to the land of promise, fan, in their children's hearts, the love of *freedom*! . . . Speak, speak, marble lips! teach us the love of *liberty* protected by law. *Everett*, Eulogy of Lafayette.

The distinguishing marks of a *freehold* (in England) were, (1) that it should last for life, . . . (2) that the duties or services should be free: that is, worthy the acceptance of a free man. To fulfil this latter condition, it was necessary that the services by which the land was held and by the non-performance of which it would be forfeited should be honourable (that is, not servile) in respect of their quality, and certain in respect both of their quality and quantity. *Mozley and Whately*, Concise Law Dict.

(b) Hence, in general, an estate in land such as was originally considered as being an ownership of the soil itself, as distinguished from a mere use or *chatel* interest in it. That is, it is an estate in possession, either of indefinite future duration, transmissible to one's heirs (called an estate of inheritance), or for the life of either the owner or some one else; or "an estate in possession, the duration of which is not fixed or ascertained by a specified limit of time" (*Digby*).

See *freehold*, 1. Under various laws in England and the United States, the right of suffrage and the qualification for some minor local official duties or trusts have been conferred on freeholders as distinguished from other inhabitants. In Scotland the term is applied to one holding lands of the crown.—Chosen *freeholders*, in New Jersey, a board of county officers having charge of the finances of the county, corresponding to the county *commissioners* or the board of *superintendents* of other States.—*Freeholders' court*. Same as *court-baron*.

O. W. Holmes, Poetry.

3. In *early Eng. hist.*, a ceorl; one admitted to a share in the land and corporate life of the village community.

The *freeman* (in Anglo-Saxon times) was strictly the freeholder, and the exercise of his full rights as a free member of the community to which he belonged became inseparable from the possession of his "holding" in it. It was this sharing in common land which marked off the *freeman* or ceorl from the unfree man or læt, the tiller of land which another owned.

J. R. Green, Making of Eng., p. 191.

freemartin (frē'mār'tin), *n.* A cow-calf twin-born with a bull-calf. It is generally barren, and when this is the case on dissection is found to have parts of the organs of each sex, but neither perfect.

freemason (frē'mā'sn), *n.* [Not found earlier than mod. E.; < *free* + *mason*.] A member of an order, fraternity, or brotherhood forming a secret society, or series of affiliated secret societies called lodges, now existing in all the countries of Europe, in many parts of America, and in other parts of the world where Europeans have settled in larger or smaller communities. This society is founded on and professes the practice of social and moral virtue; truth, charity in its most extended sense, brotherly love, and mutual assistance being inculcated in it. It possesses an elaborate ritual, numerous grades of officers, and many secret signs and passwords, by which members may make themselves known to other members of the craft in any part of the world. Secret organizations of free or enfranchised operative masons, with similar rituals, were formed in the middle ages, when skilled workmen moved from place to place to assist in building the magnificent sacred structures—cathedrals, abbeys, etc.—which had their origin in those times, and it was essential for them to have some signs by which, on coming to a strange place, they could be recognized as real craftsmen and not impostors. There was such a society of actual masons and builders in England in the seventeenth century, and some persons not belonging to the craft had been accepted as members of it; hence the full name of the present fraternity, "Free and Accepted Masons" (abbreviated *F. and A. M.*). Modern freemasonry dates from the organization in 1717 of the four lodges then existing in London, on a new basis, into a grand lodge, by which other grand lodges were chartered. To mark its departure from the limited scope of the original society, the principles and methods of the order are called *speculative masonry*, the terms and insignia of operative masonry being retained. Fable, though absolutely without any historical basis, takes the history of the order back to the Roman empire, to the Pharaohs, to the building of Solomon's temple or the tower of Babel, or even to the building of Noah's ark.

The early application of the term was to those who occupied a rationalistic position in regard to current religious beliefs and dogmas; hence it acquired the still current sense of skeptic, infidel, and even atheist. The word, though employed earlier, is generally supposed to have been brought into common use in 1713 by the publication of Anthony Collins's "A Discourse of Freethinking, occasioned by the Rise and Growth of a Sect called *Freethinkers*." Although this work defines *free-thinking* as the endeavor to judge a proposition according to the weight of evidence, and does not explicitly maintain any proposition which can offend a Protestant, it was rightly judged to be a covert attack upon fundamental tenets of the Christian religion. The free-thinkers specifically so called formed a class of deist writers in England in the seventeenth and eighteenth centuries, the chief of whom were Toland (died 1722), Anthony Collins (1676–1729), Woolston (1689–1733), Tindal (died 1733), and Bolingbroke (1678–1751). See *deist*.

The idiot is supposed to say in his heart what David's fool did some thousands of years ago, and was therefore designed as a proper representative of those among us who are called atheists and infidels by others, and *free-thinkers* by themselves. *Addison, Religions in Waxwork.*

Is he a churchman? then he's fond of power:
A quaker? sly: a presbyterian? sour:
A smart *free-thinker*? all things in an hour.

Pope, Moral Essays, I. 157.
The *freethinker* perhaps too has imbibed his principles from the persons among whom he was bred up.
A. Tucker, *Light of Nature*, V. viii.

Who born within the last forty years has read a word of Collins and Toland and Tindal and that whole race who called themselves *freethinkers*?
Burke, *Rev. in France*.

If Collins included as *freethinkers* all who differed from the prevalent creed of the time, Bentley would not deny that *freethinkers* had done good service. If, on the other hand, Collins meant, as Bentley assumed him to intimate, that all these *freethinkers* were atheists, then he was palpably wrong.
Leslie Stephen, *Eng. Thought*, iv. § 14.

free-thinking (fré'thing'king), *n.* The act or the habit of inquiring freely into the truth of a fact or point of faith in which authority requires implicit belief: especially applied to skeptical inquiry into the supernatural elements of Christianity.

freezing-mixture (frē'zing-miks'tūr), *n.* A mixture that has the property of producing a sufficient degree of cold—that is, a sufficiently rapid absorption of heat—to freeze liquids. In general, such a mixture consists of a solid and a liquid in which the solid rapidly dissolves: for example, hydrochloric acid and sodium sulphate. Its effect is due to the fact that the change of a solid to a liquid requires a certain amount of heat (see *latent heat*, under *heat*), and if this change goes on rapidly, a considerable lowering of temperature results. In the common case of pounded ice and salt, which gives a temperature of about 0° F. (—18° C.), there is a double change, both resulting in the absorption of heat—the melting of the ice and the solution of the salt. See *ice-machine*.

freezing-point (frē'zing-point), *n.* The temperature at which a liquid freezes; loosely, the temperature at which ice melts. The freezing-point, in the strict sense, depends on many circumstances difficult to control, and many liquids, including water, can with care be cooled several degrees below their melting-points without freezing. The melting-point of ice (water), however, is relatively fixed and readily observed. Consequently, the melting-point is always substituted for the freezing-point in making thermometers, although it is generally called by the latter name.

The freezing-point of water and the melting-point of ice, as Professor Tyndall remarks, touch each other as it were.

II. *n.* 1. The language spoken by the people of France. French is parallel with Provencal, Spanish, Portuguese, Italian, Wallachian, and minor dialects, called together the *Romance languages*, being descended from the Latin as spoken by the Romans and the peoples of the various provinces whom they brought under their dominion, mingled with the Celtic and Teutonic tongues with which Latin was thus brought in contact. (See *Romance*.) French means "the language of the Franks," a Teutonic people merged with the mixed races of Gaul, who received the Frankish name (the country being thence called *France*), but retained their Romanic speech, the Franks and other Teutonic tribes, and later the Normans, accepting the speech of the people they conquered. It is divided chronologically into *Old French* and *modern French*, the former extending from the ninth century to the fourteenth, or, with the convenient inclusion (as usually in this dictionary) of what is specifically called *Middle French*, to the sixteenth century. Old French existed in many dialects, the phrase, indeed, when unqualified or undiscriminated, including the aggregate of such dialects. The most important were the dialect of the Ile de France, which, as the "French of Paris," has become the modern literary French; and that of Normandy, the Norman or Norman French, which, transferred to England at the Conquest and there developed (see *Anglo-French*), gave much to and took much from the English, and was finally displaced by the mixed English speech thus formed. (See *English*.) By later borrowing from French, or from the Latin on the French model, the Romanic part of the English vocabulary is now to a great extent nearly identical with that of French. As the most central and highly developed of the Romance dialects, French began, in the sixteenth and seventeenth centuries, to take the place of Latin as the general language of diplomacy, polite society, and commerce. Its importance in this respect has much diminished in the present century. It is now drawn upon by other languages chiefly for terms of fine art, dress, and cookery. The use of accents as a customary part of French orthography began in the seventeenth century; they now form a rigid artificial system, often a guide to pronunciation, and reflecting generally, but with numerous exceptions, previous etymological conditions of the words concerned. Regarded as a Romance language, French is remarkable for its departure from the Latin type. In its vowel and consonant system (notably in its nasal vowels), its sweeping conjunctions, and its general destruction of final sounds or syllables, with the retention in many cases of these lost sounds in spelling, it differs markedly from other Romance languages.

And French she spak ful faire and fetysly,

2. A method of painting on walls covered with a ground or coat of plaster or mortar, to which the colors become permanently incorporated if properly chosen and applied; also, a picture or design so painted. True fresco (Italian *buon fresco*) is painting in colors mixed with water or hydrate of lime upon a wet surface of mortar made of lime and pure quartz-sand. In this method earth pigments are chiefly used, because all vegetable and many mineral pigments are decomposed by lime or altered by light. The solidity of the painting depends upon the penetration of the colors into the plaster or mortar, and upon the crystalline layer which forms upon its surface before the mortar has set, as it does in a few hours through the absorption of carbonic acid from the atmosphere. If this crystalline layer is disturbed, or if it has begun to form while the artist is painting, or if it forms between the thinner and thicker coats of color successively applied, the colors will flake and fall away. *Dry fresco* (Italian *fresco secco*) is a method of fresco-painting upon a dry surface. The last coat of plaster, or intonaco, when perfectly dry, is rubbed with pumice-stone, and well wetted with water and a little lime the evening before painting, and again immediately before the artist begins work. The first step in this process is to pounce the outline of the design upon the wall. The phrase *fresco secco* is applied also to retouching in distemper. The implements used by fresco-painters include wooden and glass floats, trowels of wood and iron, palette-knives of steel and bone, a trimming-knife, a bone or ivory stylus, and brushes of hog-bristles and other hair, of such quality as to be neither curled nor burned by lime. Compare *distemper* 2.

It is a very common error to term the ancient paintings found on church walls, &c., *frescos*, but there is scarcely an instance of a genuine fresco among them. They are distemper paintings on plaster, and quite distinct in their style, durability, and mode of manipulation. *Fairholt*.

Usually referred to F. *frier*, fry, < L. *frigere*, fry, but this is phonetically improbable. The sense points rather to L. *fricare*, rub, or to F. *fracasser*, break in pieces; but a connection with either of these verbs has not been made out. Cf. *fricandeau*.] A dish made by cutting chickens, rabbits, or other small animals into pieces, and dressing them with a gravy in a frying-pan or a like utensil. Formerly also *fricasse*.

frication (fri-kä'shön), *n.* [Early mod. E. *frication*; < OF. *fricacion*, *frication* = Sp. *fricacion* = It. *fricazione*, < L. *fricatio* (-n-), < *fricare*, pp. *fricatus*, rub: see *friction*.] The act of rubbing; friction.

Fricacion is one of the euacuacions, yea, or clensynings of mankind, as all the learned affirmeth: . . . a course warme clothe, to chafe or rubbe the hedde, necke, breast, armeholes, bellie, thighes, &c., . . . is good to open the pores.

Babees Book (E. E. T. S.), p. 246, note.

Frications used in the morning serve especially to this intention; but this must evermore accompany them, that after the *frication*, the part be lightly anointed with oyl.

Characterized by friction: said of those alphabetic sounds in which the conspicuous element is a rustling of the breath through a partly opened position of the organs, as *s* and *sh*, *z* and *zh*, *f* and *v*, *th* and *wh*, and so on. They are sometimes divided into subclasses, as sibilants, like *s* and *sh*, and spirants, like *f* and *v*. — 2. Sounded by friction, as certain musical instruments. See *instrument*, 3 (*d*).

fricatrice† (frik'a-tris), *n.* [*< L.* as if **fricatrice* (after *fricator*, *m.*) for *fricatrix*, *f.*, < *fricare* (pp. *fricatus* and *frictus*), rub: see *friction*.] A harlot. B. Jonson.

friction (frik'shön), *n.* [*< F. friction* = Sp. *friccion* = Pg. *fricção*, < L. *frictio* (-n-), a rubbing, rubbing down (of parts of the body), < L. *fricare*, pp. *frictus*, also *fricatus*, rub, rub down.] 1. The rubbing of the surface of one body against that of another; attrition; friction.

Fricctions make the parts more fleshie and full, as we see both in men and in the currying of horses, &c.

Bacon, *Nat. Hist.*, § 877.

The sheep here smooths the knotted thorn
With *frictions* of her fleece.

Cowper, *Mischievous Bull*.

2. In *mech.*, the resistance to the relative motion, sliding or rolling, of surfaces of bodies in contact: called in the former case *sliding*, in the latter *rolling friction*. It is partly due to the adhesion of bodies, but the greater part of it is the result of their roughness. The friction proper is independent of the velocity and of the area of contact; it depends solely upon the nature of the two surfaces and upon the pressure upon them, to which it is directly proportional. What is sometimes called the *internal friction* of fluids is *viscosity* (which see). The friction of a fluid upon a solid is considerable; it is now recognized as an important factor in the designing of ships.

3. Figuratively, lack of harmony; mutual irritation; worrying; difficulty.

Many causes, and among them that personal *friction* which is the despair of all who would make History a science, had produced among the peasantry such intensity of hatred to their lord that they were ready to find allies against him anywhere.

Maine, *Early Law and Custom*, p. 327.

The whole number of horses for the field armies, some 360,000, would, by the system which prevails, be furnished immediately and without *friction*.

friction-balls (frik' shon-bälz), *n. pl.* Balls placed under a heavy object to reduce the friction while that object is moving horizontally. Some forms of swing-bridges have such balls placed under them.

friction-brake (frik' shon-bräk), *n.* 1. A brake acting by friction on some part, as of a moving vehicle.—2. A form of dynamometer invented by Prony.—3. An apparatus for testing the lubricating properties of oils.

friction-breccia (frik' shon-brech' iä), *n.* In *geol.*, angular or sometimes imperfectly rounded fragments of rock filling more or less completely the cavity left between the sides or walls of a fault or fissure. This material may have been torn from the walls as one of the results of the violent motion to which the rock was subjected at the time the fissure originated, or it may have fallen in from above after the cavity had been formed. Mineral veins are not infrequently made up in considerable part of brecciated material derived from the rubbing together and crushing of the adjacent rock. Large masses of rock thus occurring in a vein are called *horres*. Friction-breccia is also sometimes called *fault-rock*. See *vein* and *horre*.

friction-card (frik' shon-kärd), *n.* The diagram produced by the indicator of a steam-engine when it is applied to exhibit graphically the power of an engine working without load.

friction-clutch (frik' shon-kluch), *n.* In *mach.*, a form of friction-coupling.

friction-cones (frik' shon-könz), *n. pl.* In *mach.*, a form of friction-coupling consisting of two cones, one of which is fitted into the other and communicates its motion to it by means of the friction between the two surfaces. See *friction-coupling*.

friction-coupling (frik' shon-kup' ling), *n.* In *mach.*, a device for conveying motion from one line of shafting to another by the frictional contact of cones, expanding toggles, and clutches of various forms. In all these appliances a sleeve sliding on one of the shafts and turning with it may be advanced or drawn back at will to bring the parts into action. In the friction-cone coupling a conical disk is pushed at will into a hollow cone, the two surfaces fitting closely together and either, when in motion, imparting its motion to the other by friction. In other friction-couplings the sliding sleeve causes a pair of toggles to expand against the inner rim of an idle pulley, and by their contact to impart to it their motion; or the movement of sliding levers over a cone causes two pulleys to be drawn together into frictional contact, or causes two disks to press one against the other. In all these couplings the object sought is to connect parts of a line of shafting by frictional contact instead of direct contact, as in a geared wheel, and to obtain the same advantages in a coupling that are found in friction-gearing.

Friction-coupling.

to connect parts of a line of shafting by frictional contact instead of direct contact, as in a geared wheel, and to obtain the same advantages in a coupling that are found in friction-gearing.

friction-gear (frik' shon-gër), *n.* Same as *friction-gearing*.

friction-gearing (frik' shon-gër' ing), *n.* A method or system of imparting the motion of one wheel or pulley to another by simple contact. The advantages of this kind of gearing are threefold: it enables the parts of a machine to be thrown quickly into or out of play; it gives a variable speed or power; and it prevents the injury caused by a breakage or stoppage from extending from one part of the mechanism to another or from the machine to the motor. The most simple form of friction-gearing is a pair of wheels with thin faces, which may be covered with leather, a fabric, or other elastic material, in more or less close contact. In some such wheels the faces are grooved, or the wheels are cone-shaped and placed at a right angle and with grooves cut on the faces. In others a collar on a shaft may carry pivoted arms which it turned one way press against the inner face of a wheel, and it turned the other way fall back out of contact and cease to impart their motion. In other forms one wheel revolves within another, contact being assured by means of springs. If the resistance overcomes the springs the contact is destroyed and motion is no longer imparted. Variable speed and reversal of direction are also secured by causing a friction-wheel placed at right angles with a disk and against

Friction-gearing, grooved.

it to move from the rim toward the center or past the center of the disk, as in the feed-motion of some forms of gang-saws.

frictionless (frik' shon-les), *a.* [*< friction + -less.*] Without friction.

Were water absolutely *frictionless*, an incline, however small, would be sufficient to produce a surface-flow from the equator to the poles.

J. Croil, *Climate and Time*, p. 220.

The joints and bearings of all the levers are made *frictionless* by using flexible steel connecting pieces instead of knife-edges.

Encyc. Brit., XXII. 697.

friction-match (frik' shon-mach), *n.* A match tipped with a compound which ignites by friction: the usual form of match in domestic use. The first chemical matches were invented in Paris in 1805; and soon after 1827, when the composition of friction-matches was much improved by an English chemist, they came into general use, superseding the various applications of the flint and steel which had until then been relied on.

friction-plate (frik' shon-plät), *n.* 1. A metal plate attached to any surface to prevent abrasion or resist friction.—2. A plate used in connection with a clamp to check the recoil of a gun-carriage.

friction-powder (frik' shon-pou' der), *n.* A composition of chlorate of potash and antimony, which readily ignites by friction.

friction-primer (frik' shon-pri' mër), *n.* A friction-tube. [U. S.]

friction-sound (frik' shon-sound), *n.* In *pathol.*, the sound perceived on auscultation of serous surfaces which rub together when through disease they are roughened or not well lubricated.

friction-tight (frik' shon-tit), *a.* In *mach.*, fitting so tightly or closely that a desired effect of friction is produced. Noting—(a) A mechanical fit, joint, or union between the surfaces of two assembled parts so close that any motion given to one part will be transmitted to the other without slipping, as a contact between two curved surfaces so perfect that their reciprocal pressure is sufficient to transmit any motion of rotation applied to one to the other without the interposition of any locking device, as a key, gib, splice, screw-thread, set-screw, or polygonal surface. (b) A close fit produced by a pressure sufficient to retain a part in its position when acted upon by its weight alone.

friction-tube (frik' shon-tüb), *n.* *Milit.*, a tube used in firing cannon, sufficient heat being generated in it by friction to ignite friction-powder. [Eng.] Called *friction-primer* in the United States service.

friction-wheel (frik' shon-hwël), *n.* In *mach.*: (a) A form of slip-coupling applied in cases where the variations of load are sudden and great, as in dredging-machinery, etc. In the form illustrated a strong pulley, B, is keyed on the driving-shaft, and on the circumference of this a wheel, A, is fitted, with a series of friction-plates, a, a, a, interposed, and retained in recesses formed in the eye of the wheel. Behind each of these plates a set-screw, b, is inserted, which bears against the back of the plate, and can be tightened at pleasure to regulate the degree of friction required for the ordinary work; but should the pressure on the circumference of the wheel A exceed this, the plates slide upon the circumference of the pulley B, which continues to revolve with the shaft, and the wheel itself remains stationary. (b) One of two simple wheels or cylinders intended to assist in diminishing the friction of a horizontal axis. The wheels are simply plain cylinders, carried on parallel and independent axes. They are disposed so as to overlap pair and pair at each end of the main axis, which rests in the angles thus formed by the circumferences. The axis, instead of sliding on a fixed surface, as in ordinary cases, carries around the circumferences of the wheels on which it is supported with the same velocity as it possesses itself, and in consequence the friction of the system is proportionally lessened.

A late improvement in what are called *friction-wheels* . . . consists of a mechanism so ordered as to be regularly dropping oil into a box which encloses the axis, the nave, and certain balls upon which the nave revolves.

day, dies Veneris or Veneris dies (> It. Venerdi = Cat. Divendres = Sp. Viérnes = F. Vendredi, Friday; the Pg. term is *sexta-feira*, lit. sixth fair, i. e., day). The name *Frigg* appears in Icel. only as the name of a goddess, the wife of Odin, different from *Freyja*; in AS. from the same root as *free*, *friend*, *frith*, etc.; cf. Skt. *prithā*, i., one beloved: see *free*, *friend*, *frith*.] The sixth day of the week. Friday is the Mohammedan sabbath or "day of assembly." It is said in the Mohammedan traditions to have been established by divine command as a day of worship for Jew and Christian alike, as being the day on which Adam was created and received into Paradise, the day on which he was expelled from it, the day on which he repented, and the day on which he died. It will, according to the same traditions, be the day of the resurrection. In the Roman and Eastern and Anglican churches, all Fridays except Christmas day (when it occurs on Friday) are generally observed as fasts of obligation or days of abstinence, in memory of the crucifixion of Christ, an event which is more especially commemorated annually on Good Friday (see below). In most Christian nations Friday is popularly regarded with superstition, and is considered an unlucky day for beginning any enterprise; to spill more or less salt on Friday is considered an especially bad omen. Until recently it was common for criminals under sentence of capital punishment to be executed on Friday; hence Friday is sometimes called *hangman's day*.

Good Friday, the Friday before Easter, a holy day of the Christian church, in memory of Christ's crucifixion, of which this day is taken as the anniversary. The early church observed it as a strict fast; in the church services doxologies were omitted, no music except the most plaintive was allowed, and the altars were stripped and draped in black. At present, in the Greek and Roman Catholic churches, Good Friday is a solemn fast; and it is also observed with special services and prayers by the Church of England, and the Protestant Episcopal Church in the United States, and by the Lutherans, German Reformed Church, Moravians, and many Methodists.

Alien friend, a foreigner whose country is at peace with one's own.—**Friends of God**, a name assumed by an unorganized brotherhood of German mystics existing in the fourteenth century, who, in opposition to the formalism and ecclesiasticism of their age, emphasized the possibility and duty of complete self-renunciation and intimate spiritual union with God. Prominent among the leaders were Nicholas of Basel and John Tauler. As they were not bound together by either an ecclesiastical organization or a common creed, their views of religious truth differed, and some of their utterances gave rise to charges of pantheism and antinomianism.—**Friends of Light, Protestant Friends**. See *Free Congregations*, under *congregation*.—**Next friend** (Law F. *prochein amy* or *ami*), in law: (a) In some jurisdictions, a person by whom an infant or a married woman sues, and who is responsible for costs. (b) In Scots law, a tutor or curator.—**Progressive Friends**, a religious society first formed in 1853 in Pennsylvania, rationalistic in its theological tendencies, but disclaiming the binding obligation of creeds and the exercise of disciplinary authority.—**Society of Friends**, the proper designation of a Christian sect commonly called Quakers, which took its rise in England about the middle of the seventeenth century through the preaching of George Fox. A division occurred in portions of the society in America in 1827, through the preaching of Elias Hicks, whose followers, commonly called *Hickites*, hold doctrinal views closely approximating those of the Unitarians, while in church government and other respects they retain the

usages of the orthodox Friends. The latter agree doctrinally with other evangelical Christians, but lay greater stress on the doctrine of the personal presence and guidance of the Holy Spirit. They have no paid ministry, and accept the ordinances of baptism and the Lord's supper in a spiritual sense only, rejecting their outward observance as church rites. They condemn all oath-taking and all war. The organization of the Society involves four periodical gatherings called "meetings": namely, preparative meeting, monthly meeting, quarterly meeting, and yearly meeting. The body called the Yearly Meeting has supreme legislative power. There are two Yearly Meetings in Great Britain, one in Canada, and ten in the United States.—**To be friends with**, to be in a relation of mutual or reciprocal friendship with.

The proper AS. form is **frithborh*, < *frith*, peace, + *borh*, a pledge (> E. borrowl, n.). Cf. *frithsoken* and *frank-pledge*.] In Anglo-Saxon law, one of the things or groups of ten men into which the hundred was divided, the members of each one being held liable for the misdeeds of a fellow-member.

As touching the king's peace, every hundred was divided into many *freeborgs* or tithings consisting of ten men, which stood all bound one for the other, and did amongst themselves punish small matters in their court for that purpose called the lete.

Strong as the crown might be, its strength lay in the king's personal action, and it was far from possessing any adequate police or judicial machinery for carrying its will into effect. To supply such a machinery was the aim of the *frith-gilds*.

J. R. Green, Conq. of Eng., p. 219.

frithsoken (frith'sô'ken), n. [Also *frithsocene*, *frithsoen*, *frithsoea*; ME. *frithsocene*, "franchise de franc plege" (Rel. Antiq., I. 33), < AS. *frithsôcn*, lit. a peace-seeking, < *frith*, peace, + *sôcn*, a refuge, searching, a seeking: see *frith*¹ and *soken*, *socage*.] 1. In Anglo-Saxon law, the franchise or governmental power of requiring the people to keep the peace; the jurisdiction to punish for breaches of the peace. This power was profitable by reason of the fines and forfeitures resulting from its exercise; consequently it was often conferred in the charters and royal grants of early English history, beginning in the later part of the Anglo-Saxon period, about the time of Edward the Confessor. (See *soc*.) The Normans, it is supposed, by confusing the Anglo-Saxon *frith* with *fre*, *fri*, modern *free*, adopted the term *frank-pledge* to designate the binding of persons to be peculiarly responsible for one another's peaceable conduct.

Hence, in later times—2. The liberty of having a view of frank-pledge. See *frank-pledge*. **frithsplot** (frith'splot), n. AS. *frith-stôl*, an asylum, sanctuary, lit. stool of peace or protection, < *frith*, peace, protection, + *stôl*, a seat, chair, stool.] In Anglo-Saxon times, a seat or chair in a church, near the altar, to which persons fled who sought the privilege of sanctuary.

Athelstan his son succeeded King Edward, being much devoted to St. John of Beverley, on whose church he bestowed a *freed-stool* with large privileges belonging thereto.

Fuller, Church Hist., II. v. 9.

Such a privilege [the right of sanctuary or refuge for criminals] was given by allowing what was called the *Frithstool* to be set up in some part of the hallowed building. This "stool of peace," for such is the meaning of the word, was a low-backed arm-chair, made of stone. Its standing-place was either near the high altar, or by the side of the patron saint's shrine. From this spot, as from a center, the *frithstool* spread its privilege of sanctuary over land and water all about the minster which held it, to the distance of at least a mile.

frog¹ (frog), *n.* [*< ME. frogge, < AS. frogga* ("frog" not authenticated, "frogga" erroneous), a frog, akin to *AS. froz* (for "froze"), *ME. frosh, frosh, frosh*, etc. (cf. var. *froek², < ME. froke*), = *D. MLG. vorsch* = *OHG. frosc, MHG. vrosch, G. frosh* = *Ice. froskr*, a frog; cf. *Dan. frø*, a frog; *Ice. frawkr*, a frog; the origin is unknown.] A batrachian of the family *Ranidae* (which see), as the common British *Rana temporaria*, or its North American representative, *R. sylvatica*. Of the true frogs there are about 250 species, belonging to 18 genera, common in most parts of the world except the Neotropical and Austrogean regions, including for the most part aquatic or arboreal batrachians, distinguished by their agility and symmetry, as well as by their webbed toes, from the related batrachians which are popularly named toads; but the distinction is not always preserved. Of the genus *Rana* alone there are upward of 110 species, most of which are aquatic, are expert swimmers, and capable of making very long leaps; some are terrestrial, and some arboreal. Several different kinds of frogs are edible, as the common European *R. esculenta*. The largest species is the bullfrog of the United States, *R. catesbeiana*. (See *bullfrog*, and cuts under *Amura* and *Rana*.) Others of the same country are *R. palustris*, *R. halecina*, and *R. clamata*. The toes of some arboreal frogs are enormously lengthened and fully webbed, enabling the creatures to make long flying leaps. (See *flying-frog*, *Rhacophorus*.) Some have the ends of the toes dilated, like many of the toads. The tongue of most true frogs is emarginate behind, with a process on each side. Most frogs deposit their spawn in masses in the water, and the young hatch from the egg as tadpoles, provided with a tail and external gills, which disappear with the growth of the permanent limbs. The arboreal batrachians known indifferently as *tree-frogs* or *tree-toads* are not frogs in any proper sense, but belong to a different suborder (*Arceifera*) of salient amphibians. (See *Hydride*.) The name *frog* is loosely applied, with or without a qualifying term, to some other batrachians equally remote from the *Ranidae*, and locally in the United States to certain lizards. By this arrangement the steam from the fresh fruit rises to the trays above, keeping the fruit bathed in steaming vapor. fugue (fūg), *n.* [F., < It. *fuga*, also *fugga*, a
flight, a *fugue*, < L. *fuga*, a flight, < *fugere*, flee:
see *fugitive*.] In music, a polyphonic composi-
tion based upon one, two, or even more themes,
which are enunciated by the several voices or
parts in turn, subjected to various kinds of con-
trapuntal treatment, and gradually built up into
a complex form having somewhat distinct di-
visions or stages of development and a marked
climax at the end. The most general divisions of a
fugue are the exposition, the development, and the con-
clusion. A *strict fugue* is one in which each division is
developed symmetrically and in a purely contrapuntal
manner; while a *free fugue* is one that is irregular or
incomplete in plan or detail. (a) In the *exposition*, the
first voice enunciates the theme alone (subject, dux, ante-
cedent) in the tonic key; the second voice then enun-
ciates it (answer, comes, consequent) in the dominant key,
sometimes with slight alterations; the third voice then
imitates the first at the octave (usually); the fourth voice
imitates the second in the same way; and so on, until
all the voices, if there are more than four, have entered
with the theme. The earlier voices usually accompany the
later ones as they enter; and the melody added by the
first voice to the answer in the second is often contrived
in double counterpoint with it, so as to serve through-
out the *fugue* as a counter-subject or foil for the original
theme. The character of the theme gives the name to
the *fugue*; a *diatonic fugue* having a diatonic subject, a
chromatic fugue a chromatic subject, a *Doric fugue* a sub-
ject in the Doric mode, etc.: the character of the sub-
ject generally determines the character of the develop-
ment. A *real fugue* is one in which the answer imi-
tates the subject, note for note, usually at the fifth or
fourth; while a *tonal fugue* is one in which the answer
contains such slight alterations of the subject as shall ad-
just it exactly to its different tonality. A *fugue by inver-*
sion is one whose answer is the inversion of the subject;
so *fugue by augmentation*, by *diminution*, at the sixth, etc.
The order in which the voices shall enter, and the exact
relations of the answer to the subject, are both regulated
by rules. A *double fugue* has two subjects, a *triple fugue*
three subjects, etc. A *fugue in two parts* is one for two
voices only, etc. A *free part* is sometimes added to those
essential to the contrapuntal development of the *fugue*.
(b) In the *development*, the subjects, answers, and counter-
subjects are used repeatedly, either wholly or in part,
in different keys, under varying treatment, so as to un-
fold their entire contrapuntal capacity. The successive
sections should have an increasing contrapuntal interest
and intricacy, and should be closely bound together;
though episodes or diversions from the orderly treatment
of the principal themes may be inserted between the sec-
tions for contrast. (c) In the *conclusion*, the theme is

usually presented by all the voices in turn, as in the exposition, but frequently so rapidly that the entries overlap. Such an overlapping section is called the *stretto*. In connection with this, and usually as the final section, a pedal point is often introduced. The fugue is the consummate form of the polyphonic style of composition, requiring for its successful production a mastery of all the devices of counterpoint, as well as a very high grade of inventive and constructive genius. The greatest writers of fugues are J. S. Bach (1685-1750) and G. F. Handel (1685-1759).

They are remarkable for the prolongation of the forehead into an empty vesicular expansion, and are so named because it has been asserted that the lantern-fly proper (*P. lanternaria*), a native of Guiana, emits a strong light from this inflated projection. The evidence of this luminosity, however, is more than doubtful. A Chinese species has, on equally equivocal testimony, been called *F. candelaria*. *See lantern-fly*.

The family *Fulgoridæ* is distinguished by the presence of the great lantern-flies, and includes also a host of other species of very diverse forms and of many varieties of structure. It contains forms which might have been mistaken for butterflies and moths, and others which closely

The wing-covers are generally opaque, and narrower than the wings. . . The family is now divided into thirteen subfamilies.

They have a pear-shaped shell with a long anterior canal and a single fold around the base of the columella. The most common species are *Fulgur carica* and *Sicyotypus canaliculatus*.

fulgurite (ful'gū-rīt), *n.* [L. *fulgur*, lightning, + *-ite*².] A tube formed, usually in loose sand, but sometimes in the solid rock, by lightning; a lightning-tube. Fulgurites are the result of the passage of the electric current through the soil, sand, or rock, producing more or less complete fusion in the vicinity of the path traversed. They usually descend vertically, but sometimes obliquely, and they occasionally branch toward the bottom. They are rarely more than one or two inches in diameter. The effect of lightning is sometimes seen, and occasionally on a large scale, where no proper fulgurites have been formed, but rather a sort of honeycombed condition of the rock, resembling that produced in wood by the boring of the teredo, as observed on Little Ararat, and described by Abich. For the rock (andesite) thus vitrified and altered this geologist proposes the name *fulgurite andesite*.

There are about 10 species, of most parts of the world. The common European coot is *Fulica atra*; that of the United States is *F. americana*. (See *coot*.) The species are usually good divers, and they feed upon animal food to a greater extent than river-ducks. They are by no means exclusively marine or maritime. The pochards, scaups, canvasbacks, golden-eyes, long-tailed and harlequin ducks, scoters, eiders, etc., all belong to this subfamily.

upper mandible. It inhabits the northern seas in prodigious numbers, breeding in Iceland, Greenland, Spitzbergen, the Shetland and Orkney Islands, the Hebrides, etc. It feeds on fish, the blubber of whales, and any fat, patrid, floating substance that comes in its way. The fulmar is also valued for its feathers, its down, and the oil found in its stomach, which is one of the principal products of St. Kilda. When caught or assailed, it lightens itself by disgorging the oil from its stomach. There are several closely related species or varieties in the North Pacific. The slender-billed fulmar is *Fulmarus tenuirostris* or *Thalassica glacialis*, widely dispersed over the seas. 6. In *math.*, a mathematical quantity whose value depends upon the values of other quantities, called the arguments or independent variables of the function; a mathematical quantity whose changes of value depend on those of other quantities called its variables. Thus, if the diameter of a circle be conceived to vary in length, the length of the circumference will also vary with it, in accordance with a fixed geometrical law, and is therefore a function of the diameter, the latter being regarded as the independent variable. So in the equation $y = ax + b$, if x be conceived to vary independently, y will be its function, since its value will vary with each successive value of x . The common algebraic notation is $y = f(x)$, to be read " y is a function of x ." F, f , and other letters are often used in place of f . It is not the special value of f_x , but this quantity considered as variable and as depending upon x , which is called the *function*. It is even called the same *function* irrespective of the special values of certain parameters upon which it may depend, and which are considered not as variables, but as constants. The earlier analysts used *function* to mean merely a power, or continued product of a quantity into itself. The present mathematical meaning first appears in the Latin correspondence between Leibnitz and John Bernoulli. Mathematical usage is not precisely settled as to the meaning, and this in two respects. First, as some writers use the word, the possible values of the function depend upon the values of the variables; so that, if y is a function of x , there must be some value which y can take for some value of x , which it cannot take for some other value of x . But other writers hold that two quantities which are functions of a third are functions of each other. For example, if $x = \tan t$ and $y = \tan(\sqrt{2}t) + \tan(\sqrt{3}t)$, they hold that y is a function of x , although it can take every value for every value of x ; for there is even here a connection between the values of x and y , so that in the course of any continuous change of x the mode of change of y is somewhat restricted. Secondly, according to the usage of Cauchy and his followers, if an imaginary quantity, $X + Yi$, be so connected with another, $x + yi$, that X and Y are each of them functions of x and y , say $X = F(x, y)$ and $Y = f(x, y)$, then the former imaginary is a function of the other; but the majority of mathematicians have restricted the name *function* to what the school of Cauchy would term monogenous and differentiable functions, although such a restriction is impossible where the variable does not vary continuously. The tendency of recent writers is to give the greatest possible breadth to the application of the term.

It is *active* when the bulk of it is invested in the subjects of the business or enterprise, as merchandise, ships, factories, land, bank-loans, etc.; *passive* when it is invested in such a way (as in real estate or stocks) as to produce a fixed or nearly uniform income, which alone is used for the specific purpose, or when it is used or drawn upon directly for expenses, being insufficient to produce the requisite income by investment, or when it is maintained by collections or contributions for specific objects, as the support of missionaries or of charitable enterprises. Both active and passive funds may be either *individual* or *collective*; when collective, an individual interest in the former usually consists of a partnership or the ownership of joint stock, and in the latter of membership or of some right of joint control, unless the contributions are absolute gifts.

The parliament went on slowly in fixing the fund for the supplies they had voted.

Often called simply the *funds*.—**Regimental fund**, in the United States army, 50 per cent. of the post fund, after deducting the expenses of the bakery, divided pro rata among the regiments represented by companies at the post, and paid over to the several regimental treasurers for the maintenance of the bands.—**Sinking-fund**, a fund formed by a government or corporation for the gradual "sinking," wiping out, or reduction of its debt, by various devices for the accumulation of money. (See *fund*¹, v. 2, end.) The first sinking-fund was established by Sir Robert Walpole in England in 1716.—**The funds**, originally, in Great Britain, the product of particular taxes, as customs, excise, stamp, etc., pledged by the government for the payment of particular loans and the interest on the same; now, the national or public debt, or the stocks which represent it; as, to have money in the funds. See *consols*, and *consolidated funds* (under *consolidated*).

fund¹ (*fun'd*), v. t. [*fund*², n.] 1. To collect and accumulate; store. [Rare.]

2. To convert (a floating debt) into capital or stock, or into a more or less permanent debt, represented by bonds for definite sums, bearing interest at a fixed rate, and commonly redeemable within a fixed period of years. That part of the indebtedness of a government or corporation which is payable immediately or soon, so that early provision for payment must be made or forbearance obtained, is called the *floating debt*. To fund such an indebtedness is to cancel it by inducing the creditor to take in its place obligations having considerable time to run, and issued, in convenient portions or shares, in the form of interest-bearing bonds or certificates available to the holder as marketable securities; or by procuring a fresh loan on the issue of such obligations, and using the proceeds to pay off the floating indebtedness. To refund a debt is to repeat this process when the time obtained by the funding expires. The funded debt of a body politic or corporate is the aggregate of the debt thus provided for. It is approximately the same in amount as the old debt, unless it is increased, as is often the case, by including in it the expenses of funding, or by issuing the obligations below par. The funded debts of governments are spoken of as the *public funds*, and the securities issued are spoken of as *stocks* or *bonds*. Such securities, when issued by corporations, are usually spoken of in the United States as *bonds* (the word *stocks* being applied to shares, which do not represent the debt of a corporation, but ownership in it), and in Great Britain as *bonds* or *debentures*. With the funding of a debt is frequently coupled the creation of a sinking-fund for its redemption. See *sinking-fund*, under *fund*¹, n.

fung-hwang, fēng-hwang (fung'hwāng'), *n.* [*Chinese*.] In *Chinese* myth., a fabulous bird of good omen said to appear when a sage is about to ascend the throne, or when right principles are about to triumph throughout the empire. It is usually called the *Chinese phoenix*, but seems, from the descriptions of it found in books, to resemble the Argus pheasant. It has not appeared since the days of Confucius. It is frequently represented on Chinese and Japanese porcelains and other works of art. *Fung* is the name of the male bird, and *hwang* of the female.

The *fung-hwang* of Chinese legends is a sort of pheasant, adorned with every color, and combining in its form and motions whatever is elegant and graceful, as well as possessing such a benevolent disposition that it will not peck or injure living insects, nor tread on growing herbs.

S. W. Williams, Middle Kingdom, I. 266.

Fungi (fun'jī), *n. pl.* [*L.*, pl. of *fungus*, a mushroom: see *fungus*.] One of the lowest of the great groups of cellular cryptogams. The *Fungi* are chiefly distinguished by the absence of chlorophyll, and therefore by the lack of power to assimilate inorganic substances, being thus dependent for their food upon living or dead organic matter obtained from other plants or from animals. Consequently, also, they do not inhale carbonic acid and give off oxygen as chlorophyllous plants do in assimilation, but do inhale oxygen and give off carbonic acid as other plants do in respiration. The vegetative system consists of filiform cells, called *hyphae*, and the hyphae of a fungus taken collectively are called the *mycelium*. The hyphae are usually septate and branched; in some fungi, as *Peronosporae* and their allies, there are no septa except those which divide off the propagative cells or organs. Exceptions to the hyphal plan of structure occur in several cases. In the yeast-fungi and yeast-like stages of certain other fungi the plant consists of a succession of ellipsoidal cells formed by budding; in the *Chytridiaceae* certain species have no mycelium, but consist of a spherical or ovoid cell; in the bacteria the prevailing form is that of very minute spheres or rods, which multiply by fission; in the vegetative stage of the *Myxomycetes* there is only a mass of protoplasm. The mycelium is said to be *filamentous* when the hyphae are separate, or at most but loosely interwoven, as in the common molds; *membranous* when the hyphae are so interwoven as to form a layer; *fibrous* when the hyphae form branching strands, the latter being often of considerable size and indurated. In some groups, as the mushrooms, the interwoven hyphae form a compound fungus-body of definite and regular shape. Fungi are sa-

prophytic or parasitic, according as that from which they obtain their food is a dead organic substance or a living organism. Some parasitic species are facultative saprophytes, and some saprophytic species are facultative parasites. Among the saprophytic fungi are the common domestic molds and mildews, the "dry-rot" fungi, the greater number of ascomycetous and basidiomycetous fungi, which grow on dead wood, leaves, etc., or organic matter in the soil, also many *Hyphomycetes*, and the *Myxomycetes*. Among the parasitic fungi are the *Uredineae* or rusts and *Ustilagineae* or smuts, which grow upon wild and cultivated plants, also most *Peronosporae*, as represented by the potato-rot and American grape-vine mildew. Among the *Ascomycetes*, the *Erysipheae* (powdery mildews) are all parasitic, as are also many other *Pyrenomycetes* and a few *Discomycetes*. Many parasitic species, especially the rusts, smuts, and mildews, cause great destruction to cultivated crops. The lichens are now considered by many botanists to consist of fungi parasitic upon algae (the gonidia). (See *lichen*.) A few fungi grow upon living animals and man. Several species of *Aspergillus* cause a disease (otomycosis) of the human ear. Other fungi produce the skin-diseases, *tinea* and ringworm. Bacteria are believed to cause most or all of the fevers and contagious diseases of man and the lower animals. Species of *Saprolegnia* cause epidemics among fishes, especially the salmon. The principal parasites upon insects belong to the *Entomophorae* and the genus *Cordyceps*. (See cut under *Cordyceps*.) Silkworms are attacked by a species of *Botrytis*, and bacteria cause epidemics among silkworms and other insects. Both sexual and asexual reproduction occur in fungi; the latter is present in all and in many is the only kind that has been observed. The asexual spores (conidia) are most frequently produced upon the tips of uninclosed hyphae, as in *Hyphomycetes*, or on short hyphae produced in conceptacles, but sometimes by free cell-formation, as in *Mucor*. The sexual organs are of three types. In the conjugating fungi, *Mucor* and its allies, reproduction takes place by the union of two similar cells to form a zygospore. In *Peronospora* and its allies oogonia and antheridia are formed; the antheridium comes in direct contact with the oogonium, and a transfer of the protoplasm to the oosphere takes place. In the case of *Ustilago*, so far as known, a carposporium takes the place of the oogonium, and the product of fertilization is usually a perithecium or apothecium containing asci and spores. (See *Eurotium*.) Modern classifications of fungi are of two kinds. That proposed by F. Cohn in 1872 classes together in primary groups fungi and algae having similar modes of reproduction, employing the peculiar fungal characters in distinguishing the secondary groups; but the usual method recognizes fungi as wholly distinct from algae, separated by physiological and morphological characters, in this respect agreeing with the old method. The artificial system formerly in use and still retained in some English books divides the fungi into the orders *Ascomycetes*, *Phycomycetes*, *Hyphomycetes*, *Coniomycetes*, *Gasteromycetes*, and *Hymenomycetes*. De Bary in 1861 made four divisions: *Phycomycetes*, *Hypodermiae*, *Basidiomycetes*, and *Ascomycetes*. Goebel (1882) does not include *Myxomycetes* and *Schizomycetes* with *Fungi* proper; the latter he divides into *Chytridiaceae*, *Ustilagineae*, *Phycomycetes*, *Ascomycetes*, *Uredineae*, and *Basidiomycetes*. The *Fungi Imperfecti* of modern authors include a large number of forms, of which some are known, and most are suspected to be the asexual stages of *Ascomycetes*. The principal groups of *Fungi Imperfecti* are the *Sphaeropodiae*, *Melanconiceae*, and *Hyphomycetes*. The number of known species of fungi is estimated at about 30,000. Most of the edible fungi are found among the mushrooms and puffballs; but the truffle and morel are ascomycetous. Most of the species recognized as poisonous are mushrooms; but the ergot-fungus is ascomycetous. Some smuts are poisonous to cattle. Some fungi produce poisonous substances, as alcohol, by fermentation. Also called *Fungales*. See cuts under *ascus*, *baridium*, *Clavaria*, *ergot*, *ezoperidium*, *Fucladium*, and *Puccinia*.

Fungia (fun'jī-g), *n.* [*NL.*, < *L. fungus*, a mushroom: see *fungus*.] The typical genus of mushroom-corals of the family *Fungiidae*. Lamarck, 1801. See cut under *coral*.

Fungia . . . is the largest of the solitary lime-secreting corals, and often reaches a diameter of from six to eight inches. It is disk-shaped, with a large number of radiating partitions which extend from the center to a periphery not bounded by a vertical wall. The tentacles . . . are irregularly disposed over its whole upper surface. *Fungia* in its adult condition is not attached to the ground, but lies in the coral lagoons in rather sheltered places.

Fungicolæ (fun'jī-gō-lē), *n. pl.* [*NL.*, pl. of *fungicola*: see *fungicolous*.] *1.* In Latreille's system, the first family of *Coleoptera trimera*, *prophytic* or *parasitic*, according as that from which they obtain their food is a dead organic substance or a living organism. Some parasitic species are facultative saprophytes, and some saprophytic species are facultative parasites. The *Fungi Imperfecti* of modern authors include a large number of forms, of which some are known, and most are suspected to be the asexual stages of *Ascomycetes*. The principal groups of *Fungi Imperfecti* are the *Sphaeropodiae*, *Melanconiceae*, and *Hyphomycetes*. The number of known species of fungi is estimated at about 30,000. Most of the edible fungi are found among the mushrooms and puffballs; but the truffle and morel are ascomycetous. Most of the species recognized as poisonous are mushrooms; but the ergot-fungus is ascomycetous. Some smuts are poisonous to cattle. Some fungi produce poisonous substances, as alcohol, by fermentation. Also called *Fungales*. See cuts under *ascus*, *baridium*, *Clavaria*, *ergot*, *ezoperidium*, *Fucladium*, and *Puccinia*.

Hence foret, q. v.] I. *n.* 1. The short, fine, soft coat or pelage of certain animals, distinguished from the hair, which is longer and coarser, and more or less of which is generally present with it. Fur is one of the most perfect non-conductors of heat, and therefore a warm covering for animals in cold climates. It has always been largely used for human clothing, either on the skin or separated from it. The finest kinds, as those of the sable, ermine, furs, seal, beaver, otter, etc., are among the costliest of cloths and materials, both from their rarity and from the amount of labor involved in their preparation.*

stadium), prop. the length of a furrow, or the drive of the plow before it is turned, *< furlh*, a furrow, + *lang*, long. The length of a furrow would ordinarily be equiv. to the length of the field; like other orig. indefinite terms of measure, the word came to have a definite value, being fixed by custom at 40 rods, and hence called in ML. (AL.) *quarentena*: see *quarantine*.] A measure of length equal to the eighth part of a mile, 40 rods, poles, or perches, 220 yards, or 201.17 meters. The furlong corresponds to the Roman stadium, and one eighth of any kind of mile is called a furlong in older writers. Thus, English writers of the sixteenth century often call 625 feet a furlong; and the reason is that 5 feet was taken to be a pace, so that a Roman mile of 1,000 paces would be 8 × 625 feet. So the eighth part of a Scotch mile, or nearly 742 feet, was a furlong. In the English translation of the New Testament *furlong* is used to translate the Greek *στάδιον*, stadium. Abbreviated *fur*.

furlough (fēr'lō), *n.* [The spelling *furlow* occurs in the 18th century, but *furlough* appears to be the earliest spelling (as in Blount's Gloss., ed. 1674). As the spelling *furlough* does not follow that of the orig. language, it was prob. intended to be phonetic (from a military point of view), the *gh* perhaps as *f* and the accent on the second syllable; *< D. verlof*, leave, furlough, = LG. *verlof* = G. dial. *verlaub* (these prob. of Scand. origin), *< Dan. forlov*, leave, permission, furlough, leave of absence, = Sw. *förlov*, leave, pardon; a form (with prefix *for-*, *för-* = E. *for-*) equiv. to the older Dan. *orlov*, leave of absence, furlough, = Sw. *orlov*, dismissal, discharge, = Icel. *orlof*, leave, = D. *oorlof*, leave, = OHG. In the United States army the term is used officially only for such leave given to an enlisted man, the same permission granted to a commissioned officer being designated a *leave of absence*. A soldier availing himself of the permission is said to be *furloughed*, or *on furlough*; an officer, on *leave*. The word is also used to designate the temporary discharge from service of a civilian in the employ of the government. In the United States navy it has a special signification, indicating the condition of an officer off duty either for fault or at his own request and only receiving one half of "waiting-orders pay."

See *bone-burning*.—**Bone-black furnace.** See *bone-black*.—**Calcing-furnace.** A furnace in which the operation of calcing is performed; specifically, a reverberatory furnace, with a low arch, in which hard lead is "softened" by exposing it to the action of the flame, by which the foreign metals (antimony, copper, and iron) are oxidized, and collect on the surface of the metal in the form of dross. Also called *improving-furnace*, and the process of softening is also called *improving*.

—**Carbonizing-furnace.** See *carbonize*.—**Castilian furnace.** a circular furnace, usually about 3 feet in diameter and 8½ feet high, having a breast formed by a semicircular iron pan furnished with a lip for running off the slags and a longitudinal slot for convenience in tapping. On the top of this cylinder, which is made of fire-brick, rests a box-shaped covering of masonry supported by four pillars, and in this are the feeding-door and the outlet for the products of combustion. The blast is obtained by means of a fan, and there are three tuyers. This furnace is used in Spain for smelting poor ores of lead as well as rich slags. It has also been introduced to a limited extent in England.—**Catalan furnace or forge.** a furnace used in the French Pyrenees and in some parts of Spain for the manufacture of iron, consisting of a direct furnace. It consists of a quadrangular hearth, made of some fire-resisting material, supported by one or more small arches, and built against the side of a wall like the ordinary blacksmith's forge. The blast is supplied by a peculiar kind of blowing-machine called a *troupe*, in which the current of air is produced by the falling of water through a vertical tube. See *blooming* and *forge*.—**Cementation-furnace.** See *converting-furnace*.—**Converting-furnace.** a form of furnace in which bar-iron is converted into steel by carburization (which see). It consists essentially of an oblong rectangular case, called the *chest* or *pot*, open at the top, and inclosed within an arched fire-brick chamber, with arched openings at each end, through which a man can enter. The fireplace is underneath, and that and the flues are so arranged that the chest can be uniformly heated to a high temperature. The whole is inclosed within a hollow cone of brickwork, open at the top, like a glass-furnace. Two such chests are ordinarily built side by side, space being left for flues between the adjacent walls.—**Cupola blast-furnace.** the modern form of blast-furnace, resembling the cupola used for foundry purposes in being much less massive in construction than the old-fashioned blast-furnace, but at the same time of much greater size, the largest being over 100 feet in height and 25 in diameter across the boshes. The cupola blast-furnace is built of radiating brickwork, inclosed within a wrought-iron casing.—**Cupola furnace.** See *cupola-furnace*.—**Danks rotary furnace.** a peculiar form of puddling-furnace (see *puddle*) in which the chamber in which the puddling is effected is made to rotate during the operation. It is claimed that the Danks furnace is more effective in eliminating the phosphorus and sulphur than the ordinary form of puddling-furnace.—**Decomposing-furnace.** a furnace used in the conversion of common salt into sulphate of soda, aided by the action of sulphuric acid.—**Dumb furnace.** a ventilating-furnace placed at the foot of the up-cast shaft of a mine, and arranged in such a way that, while the dangerous gases are drawn away, they cannot come in contact with the fire.—**Hardening-furnace.** in hat-making, a furnace in which the bodies of hats, folded in wet cloth, are laid upon an iron plate and hardened by the pressure of traversing-plates together with the heat and dampness.—**High furnace.** the ordinary blast-furnace: so called in literal translation from the French *haut fourneau*.—**Hydrocarbon-furnace.** a furnace in which a liquid fuel, as petroleum, is used.—**Muffle-furnace.** the small portable furnace in which is heated the muffle containing the cupels (see *cupel*) used in assaying gold and silver.—**Osmund furnace.** in metal-working, a primitive form of furnace formerly used in Sweden, and still in use in Finland, for reducing bog-

iron ore. The lining of the furnace is of refractory stone. Surrounding this, with a considerable earth-packed space intervening, is a crib of wood. The blast is furnished by bellows worked by treadles.—**Pernot furnace.** an open hearth regenerative furnace for converting iron into steel, invented in France, but also introduced, with some modifications, to a limited extent in England. It requires for its use both pig and scrap. Its chief peculiarity is that its bed is inclined at a small angle (about 6°) and rotative.

—**Plumbers' furnace.** a portable furnace used by plumbers for soldering, etc.—**Regenerative furnace.** a furnace in which the waste heat of the products of combustion is utilized by being transferred to either the air or the combustible gases, or both, entering the furnace. This transfer is effected by means of so-called "regenerators." See *regenerator*.—**Reheating-furnace.** a reverberatory furnace in which the puddled bars, piled in packets, are reheated preparatory to rolling; a balling-furnace.—**Reverberatory furnace.** a furnace in which the fuel is not brought directly in contact with the material to be acted on by the fire, but which is so arranged that the flame of the burning gases plays over or is "reverberated" upon the ore or metal under treatment. A peculiar kind of reverberatory furnace used in the manufacture of steel is called the *open hearth*. See *hearth*.—**Ring-top furnace.** a charcoal-furnace for heating smoothing-irons. It has an annular top, and cross-bars which can be removed at pleasure. E. H. Knight.—**Spanish furnace.** a form of reverberatory furnace used in Spain, and especially at Linares, one of the most important lead-producing districts in the world. Its chief peculiarity is the presence of two chambers, one of which is the reduction-chamber, while the other has a peculiar and not entirely understood action in checking and modifying the draft.—**Tank-furnace.** in glass-manuf., a furnace fitted with a tank, as distinguished from comparatively small melting-pots, to hold the molten glass.

4. [cap.] In classical myth., one of the avenging deities, called in Greek mythology the Erinyes or, by euphemism, Eumenides, and by the Romans the Furies or Diræ, daughters of Earth or of Night, represented as fearful maidens, often winged, and with serpents twined in their hair, clad in dusky garments girdled with red. They dwelt in the depth of Tartarus, and, owing to their dread power of avenging wrong, whether intentional or not, were feared by gods and men. According to fully developed Greek tradition, they were three in number and called Tisiphone, Alecto, and Megera. They relentlessly punished crime, especially breaches of piety and hospitality, both before and after death. They were therefore also regarded as goddesses of fate, in common with the Paræ; hence the use of the name in the extract from *Milton*.

fuse (fūz), *n.* [Abbr. of *fusee* 1.] A tube, casing, ribbon, etc., of various materials, filled or saturated with a combustible compound, and used as an exploder for firing a blast or for igniting any exploding charge, as of a military shell. A common fuse consists of a rope-like tube filled with some slow-burning composition, as niter, sulphur, and meal powder, its commonest use being to allow the one who ignites it time to get to a place of safety before the explosion. An *electric fuse* consists of the explosive substance so arranged as to be fired either by a spark of high-potential electricity formed at a break in an electric circuit (the so-called *tension-fuse*), or by the incandescence of a fine (for example, platinum) wire which forms part of the circuit through which the current is passed (the so-called *quantity-fuse*). By extension, devices performing the same function as the common fuse, as mechanical and chemical exploders of all kinds, are termed *fuses*. The fuses used for exploding projectiles are of four kinds: *time*, *percussion*, *concussion*, and *combination*. In the first class the time of burning is regulated by cutting the ribbon, composition-filled tube, etc., to the required length; the second is ignited by the impact of the projectile against an object; the third is operated by the shock of discharge;

while the combination-fuses combine the principles of the other classes with more or less complexity. See *blasting-fuse*. Also spelled *fuz*.—**Abel fuse**, an electric fuse invented by Abel, the explosive material of which is composed of subsulphid and subphosphid of copper with potassium chlorate. It is fired by a spark.—**Percussion-fuse**, a fuse prepared for action by the shock of the discharge, and put in action on striking the object. *Hamersley*.—**Quantity-fuse**, an electric fuse in which the conducting circuit is completed by a short piece of some substance, usually a metal, of tolerably high resistance, which is raised to a high temperature, practically to incandescence, on the passage of a current of sufficient strength.—**Safety-fuse**, a slow-burning ribbon or tape for exploding a blast.—**Tension-fuse**, an electric fuse in which the conducting circuit is not complete, the firing being accomplished by the passage of a spark.—**Wooden fuse**, a hollow plug of wood filled with fuse-composition firmly driven in, the open end being protected from moisture by a water-proof cap, used for exploding military shells. For service, a part of the plug is cut off, according to the length of time it is desired that the composition shall burn, and the plug is then driven into the hole in the shell.

2. A cone or solid conical piece in a watch or a spring-clock on which is wound a chain or cord, attached at one end to its widest part and at the other to the barrel containing the mainspring, the action of which unwinds it, transferring it to the barrel. The object of the fusee is to equalize the effect of the mainspring, as its force is relaxed through regular diminution of tension, by gradually diminishing the resistance of the chain or cord through its increasing distance from the axis of the fusee. This axis is the arbor of the main wheel, which is attached to the fusee and imparts the motion derived from the spring to the other wheels. In many watches the fusee is now dispensed with, its object being attained by other contrivances. The term is also applied to similar mechanical contrivances used for other purposes. Also called *fuse-wheel*.

It was adopted into heraldry as the *cross cramponée*. Also called *gamadion*.
